Anticipation is asserted through a number of patent anti-skidding devices, but they were all designed on the rigidly attachable notion, with that relation of the parts to each other, which distinguished the Parsons patent entirely wanting. Those most relied on are the Gifford British patent and the Clark-Wertheim-Rosenberg patents, all of which were abandoned by the patentees, no doubt partly because too early in the art, but also partly for the reason that they were all of the rigidly attached kind. Gifford says that his invention consists in combining metal with the outer part of elastic-tired wheels to prevent slipping and grip the road. The first eight of his figures show devices either going through the tire or sunk into it. The tenth and eleventh figures show a metal chain ladder, "secured to the periphery of an elastic tire." It is perfectly manifest that he never thought of a loose grip, free to travel on the tire. It is easy enough at this day, after Parsons has shown the way, to convert his metal ladder into a perfect Parsons grip. This is a common method of showing anticipation, but is not a successful one. The Gifford disclosure is also too vague and incomplete to constitute an anticipation.

The Clark-Wertheim-Rosenberg patents represent the same invention patented in different countries. In the specification of each and all of them it is said that the device (which was made for bicycle tires) is so embedded in the rubber of the tire casing that it cannot change its position as a whole. By making some changes disclosed by the Parsons invention, it is now possible to obtain fair results from its use, although it rapidly wears out. The Clark invention was for a different combination and, though not entirely inoperative, possesses little utility.

What prevents these prior patents being anticipations is chiefly this, that the relation of parts which make Parsons' novel and useful is absent. If the Gifford chain ladder be used, and the inevitable tendency toward travel around the tire results from such use, the device falls off. Or, if the side members be put far enough down to prevent this at first, then as soon as one of the cross members breaks, off goes the whole device again. Gifford came nowhere near discovering the proper relation of parts. The Parsons invention is a new mechanical combination, with appropriate location and length (shortness) of the side members, and appropriate length of cross members, which, by their combined operation, each modifying the other, looseness, circumferential travel and secureness, make a practical and successful whole.

I think the patent fully operative, useful, not for a function, not anticipated, basic to a large extent, fully valid and infringed. Defendants' grip is almost identical. Complainants are entitled to the relief asked.

### The Week's Incorporations.

Allentown, Pa.—Hamilton Automobile Co., under Pennsylvania laws, with \$10,000 capital.

El Paso, Texas—Christie Automobile Co., an Arizona corporation, admitted to do business in Texas. Capital stock, \$20,000.

Denver, Col.—R. S. Motor Co., under Colorado laws, with \$25,000 capital. Corporators—John B., Elizabeth N., Walter B. Glasser.

Fargo, N. D.—Wheelock Auto Co., under North Dakota laws, with \$5,000 capital. Corporators—W. M. Ball, J. E. Frame and D. H. Bolt.

Elmira, N. Y.—Elmira Electric Vehicle Co., under New York laws. Corporators—Eugene Diven, Donald P. Beardsley, Alexander S. Diven.

Plattsburg, N. Y.—Booth Taxicab Co.,

under New York laws, with \$2,000 capital. Corporators—Charles M. Miller, Harry L. Booth, Seth S. Allen.

Akron, Ohio.—Akron Inner Tube Co., under Ohio laws, with \$10,000 capital; to manufacture inner tubes. Corporators—J. E. Dice and others.

Hyde Park, Mass.—New England Motor Truck Co., under Massachusetts laws, with \$50,000 capital; to deal in automobiles. B. H. Piper, H. A. Henderson.

Cleveland, Ohio.—Cleveland Automobile Spring Co., under Ohio laws, with \$2,000 capital. Corporators—Christian Genl, John B. Hull, E. W. Fair and others.

Chicago, Ill.—Mercury Motor Co., a West Virginia corporation, with \$200,000 capital; to do business in Illinois; manufacturing machinery. President, Sidney A. Cryor.

Austin, Tex.—Imperial Garage & Sales Co., under Texas laws, with \$10,000 capital; general automobile business. Corporators—Paul S. Miller, J. W. Crotty, I. A. Miller.

Portland, Ind.—Bimel Spoke & Auto Wheel Wheel Co., under Indiana laws, with \$130,000 capital. Corporators—Fred Bimel, J. O. Fuqua, W. D. Schwartz, W. H. Detamore.

Newark, N. J.—T. C. M. Mfg. Co., under New Jersey laws, with \$100,000 capital; deal in automobiles and parts. Corporators—A. Morris Thomson, Allan C. Coats, William McKay.

Birmingham, Ala.—Interstate Automobile Association, under Alabama laws, with \$4,000 capital; to do general automobile business. Corporators—George M. Webb, J. B. Oates.

Indianapolis, Ind.—Pyle Spring Tire Co., under Indiana laws, with \$50,000 capital; to manufacture automobiles tires and parts—Corporators—G. C. Pyle, W. G. Hunter, W. D. Pyle.

Wilmington, Del.—Moore Electrical & Automobile Co., under Delaware laws, with \$50,000 capital; general garage and automobile business. Corporators—R. E. Moore, E. R. Pussey, E. Moore, Jr., all of Wilmington.

New York City, N. Y.—United States Wheel Co., under New York laws, with \$1,000,000 capital; to manufacture all kinds of wheels for automobiles, cars, etc. Corporators—T. Tooker, S. P. McConnell, B. M. Fellows.

Detroit, Mich.—Hale Motor & Machine Co., under Michigan laws, with \$125,000 capital; to manufacture motors, transmissions and general automobile parts. Corporators—S. E. Hale, Cleveland; Charles Ritter, J. C. Hudson, Henry C. Walters, R. J. Brennan, Joseph W. Humphrey, J. E. Dubois, Fred Houser, of Detroit.

### Increases in Capitalization.

Indianapolis, Ind.—Novel Carburetter Co., increases capital to \$15,000.

## IN THE RETAIL WORLD.

Mrs. Katherine O'Gorman has opened a garage on Miles avenue, near Lloyd avenue, Providence, R. I. The building is 100x50 feet.

A. R. Hale & Son have leased the store at 1040 South Main street, Los Angeles, Cal., and will conduct an automobile supply business.

Mr. Post has filed plans for the erection of a three story garage, 74x125 feet, at 404 Eleventh avenue, New York City. The cost is estimated at \$40,000.

A garage that will cost \$30,000 is being built on the site of the old Bancroft Seminary property in Frankford, Pa. J. Harary Schumacher is the owner.

A new concern, styled the Park Garage, has been opened on South Ervay street, Dallas, Tex. T. E. and R. A. Harvey will manage the establishment.

J. M. Goodbar is going into the garage business on fourth street, Memphis, Tenn. The building will be of brick, one story high, and cost about \$10,000.

W. E. Luetgens and Edward P. Brown have formed a partnership and will open an automobile supply store in Manchester, Conn. They will sell bicycles also.

The Acme Vulcanizing Co. is the style of a new concern which has opened a plant in North Seventh street, Terre Haute, Ind. Cordell and Pinkston are the owners.

Davis & Smith is the style of the latest firm which has gone into the garage business in Biddeford, Me. They are located at the corner of Graham and Union streets.

The firm of P. W. Schulte & Co., Detroit, Mich., has been dissolved. Mr. Schulte keeps the garage, while his partner, Charles Berdan, will act as agent for the Kissel Kar.

Devoted exclusively to the repairing of automobile and bicycle tires, a shop has been opened at 221 West Seventh street, Wilmington, Del. H. P. Goslin is the manager.

The Taylor Motor Distributing Co. has moved into its new salesrooms at 210-212 North 13th street, Philadelphia, Pa. Warren-Detroit "30" and Matheson cars are shown.

W. F. Alley, of Jacksonville, Fla., has purchased the business of the Roberts Motor Car Co., 314 West Monroe street. The name has been changed to Metropolitan Garage.

George Checkets, formerly of New York City, opened an automobile supply store on Railroad avenue, South Hamilton, Mass. Connected with the store will be a garage and salesroom.

Marcus Bros. have discovered the "Promised Land" in Canaan, Mass., and have acquired the Canfield garage there. The business in the future will be known as the Canaan garage.

W. J. Burt Motor Car Co. is the style of a new firm located at 10th and Main streets, Los Angeles, Cal. Repairing and the furnishing of spare parts is to be a specialty of the concern.

The W. C. Moore Auto Co., of Forty Fort, Pa., is erecting a brick garage at a cost of \$8,000. Besides doing general repair work, the company will deal in accessories and spare parts.

The Benoist-Buel Co. has succeeded to the business of the Benoist Bros. Mfg. Co., St. Louis, Mo. Walter C. Buel is the new partner in the firm, which is established at present at 3923 Olive street.

J. A. Boyd has organized the Commercial Auto Sales Co. for the sale of Chase delivery vehicles and Gramm trucks in Cleveland, Ohio. The salesrooms are located at 2158 East 9th street.

The entire plant of the White Steamer Garage Co. in Seattle, Wash., including four automobiles and a complete repair equipment, was destroyed by fire on May 13th. The loss approximately was \$20,000.

The Sharman Automobile Co., formerly on State street, Salt Lake City, Utah, has moved to new quarters at 164 East First South street. A renting and repair department has been added to the salesrooms.

The Cleveland Taxicab Service Co., Cleveland, Ohio, has absorbed the Citizens' Taxicab Co. and installed a new equipment of Stearns taxicabs. The color of the new cabs will be gray with red running gear.

The Mathews Garage Co., which was incorporated recently, has opened up at 57 John street, Bridgeport, Conn. The new garage contains about 10,000 square feet of floor space. Atlas cars are to be featured.

Meyers & Rosenstiel, who conduct an automobile garage at 54-56 Galena street, Freeport, Ill., have taken over the Mernitz Bros' garage on Jastram place. For the present they will conduct both establishments.

Hartford, Conn., has another exclusively electric garage added to its list. The new firm is styled Electric Auto Station and is located on Church street, between High and Union place. It will specialize in Baker electrics.

The garage hitherto conducted by the Mead Motor Car Co., on Juliana street, Parkersburg, W. Va., has changed hands. The new concern will be known as the Parkersburg Motor Car Co., with William Caskey as manager.

R. C. Shallberg, Davenport, Ia., has bought the property at 1204 Fourth avenue and will erect thereon a two-story brick garage, 45x150 feet. Oscar and Fred Shallberg, brothers of the owner, will manage the business.

Martin Sauer's garage and repair shop,

in Ida Grove, Ia., was destroyed by fire on May 17th. Several automobiles were burnt, and a damage estimated at \$10,000 was caused. Only a part of this loss is covered by insurance.

Lea, McKallip & Abbey, automobile dealers at 608-610 Travis street, Houston, Tex., have changed their firm name to Lea Auto Co. Jackson, Glide, Fuller and Babcock electrics are handled and a renting department has been added.

I. M. Powell, of Cordele, Ga., has purchased the lot between the Central Hotel and the Opera House, and will build thereon a garage. The building is to be of brick and will be 75x100 feet, and two stories high; it will cost \$10,000.

Max S. and Morris Apt are building a one-story brick garage at the corner of Montgomery avenue and Clifford street, Philadelphia, Pa. The building will be 126 by 32 feet, with a wing 97 by 113 feet which is to be used as a repair shop.

The Automobile Auction & Commission Co. has opened a garage and auction salesroom at 559-561 Seventh avenue, Pittsburg, Pa. Besides carrying on a regular garage business, the firm will deal in accessories and hold public auctions every Friday.

Frederick J. Cosgrove, proprietor of a garage at 527 East Superior street, Duluth, Minn., has filed a petition in voluntary bankruptcy. He places his liabilities at \$3,561.95 and his assets at \$560.35 in outstanding accounts and \$16,904.14 in stock in trade.

Reynold MacDonald of Fredonia and L. M. Whitton of Olean have formed a partnership to deal in automobiles and make repairs. The salesrooms and garage will be located in Mayville, N. Y., and be operated under the style The Fredonia and Olean Garage Co.

Ten dwellings now standing at 23d and Market streets, Philadelphia, Pa., are being demolished rapidly to make room for a four-story garage which will be occupied by the Autocar Co. The building will be of brick and reinforced concrete and will cost \$90,000.

Sam Johnson Auto Co., Inc., is the style of a new concern in Los Angeles, Cal., which has bought the repair establishment formerly occupied by the Auto Vehicle Co., and the California Automobile Co., covering 20,000 square feet of floor space. Besides doing a general garage business, the firm handles Tourist cars.

An involuntary petition in bankruptcy against the Stearns Auto Livery Co., Milwaukee, Wis., was filed May 18th. Two of the officers of the company are among the petitioners. F. W. Chase, vice-president, claims \$550 loaned to the company, and A. F. Eckstein, secretary, \$227.53 on the same account. The petition sets forth that the company admitted its inability to pay its debts in writing on May 17th.

# White Steam and Gasoline Cars for 1911

Having disposed of our 1910 product, we now announce our steam and gasoline models for 1911.

Full details regarding the new models, dates of delivery, etc., may be obtained on application to any of the offices or agencies of the company.

### The Development of Sane Driving.

Nothing more surely marks the foolish novice at automobile driving than a furious "slam-bang" method of proceeding through city traffic, in contrast with the calm and, one may say, polite way of the veteran. It is only a few years back that practically everyone who drove a car was in a degree a novice, because cars themselves were a new thing, but sufficient time has elapsed to develop distinct extremes between veterans and newcomers. Happily the former now set an example which the latter are wise to emulate.

In one aspect it is quite wonderful how some of the old-time "daredevils" have tamed down, so that a ride with them no longer is a case of having one's heart on one's tongue, but is as quiet and uneventful as basking on a cotton-wharf. It is not fines or accidents that have curbed their spirit so much as it is an appreciation of

the eternal fitness of things, emerging after the novelty of motoring has worn off.

There are evidences of a growing courtesy in the relation of automobile drivers not only to each other but to horse and trolley traffic as well. The chief violators of this courtesy are a few "low brows" and the novices. The "low brows" perhaps never can be brought to any sense of ethics in driving, but will remain hoggish, aggressive and unpleasant until they break their last car under them. The novices, however, are more promising, as it is possible to dissuade them from "raw" driving and from making pests of themselves, if they can be shown that there really is a finer art in "smooth," sane and courteous driving.

### Wearing Qualities of Small Cars.

Though the impression generally prevails that the average small car by no means is as durable as is the average larger and more expensive machine, due consideration of the relative conditions surrounding the two leads to the conclusion that sometimes one may be just as good as the other insofar as actual wearing quality is concerned. In other words, given the same sort of attention, it is not irrational to suppose that many of the cheaper and lighter machines would run nearly as many miles under normal highway and load conditions as the larger and more costly cars, were they given the same regular attention. This is not the same as saying that the added cost of the expensive vehicles is all profit or all equipment, but rather that the rickety condition into which so many small vehicles evolve after a year or two of service results quite as much from lack of careful upkeep as from any structural shortcomings which they may possess.

It is a fact that a majority of the low priced cars go into the hands of private owners who do most of the work on them with their own hands, and exercise their own judgment as to what is and what is not absolutely necessary to the satisfactory performance of the machine. Thus it happens not infrequently that such a car is allowed to deteriorate very rapidly, necessary adjustments being postponed until excessive wear has taken place, oil and grease reservoirs being allowed to become foul with sediment and such repairs as are necessary not infrequently being made in a hasty and slipshod manner. The inevitable result is

that cars of this order rapidly fall away, and while they may give excellent service and most creditably fulfil the requirements of their owners, their noisy performance and dissolute appearance leads to the hasty conclusion that they are worth far less than they really are.

The more costly products, receiving the constant attentions of a paid driver, are maintained in better shape. As a rule, too, their owners are willing to make a greater outlay in keeping up their appearance; so that they seem to wear better than do the small and cheap cars. That the latter also are apt to receive less expert handling on the road, to be put through more bone racking "stunts" and to be overloaded more frequently is another point tending to their disadvantage.

The point is that owing to the conditions surrounding their respective use, the small car constantly is at a disadvantage over the larger one, seldom is worked to best possible advantage and generally gives the impression of being less enduring than it really is. This discrepancy in the working conditions surrounding the use of large and small cars, added to such inherent disparities as really do exist, tend to heap upon the little car an amount of contempt on the part of the possessor of a large machine of which it in no wise is deserving.

### Possibility of V-Type Engines.

Many considerations point to the utility of the V-type of engine for certain classes of car, and it is not at all unlikely that its use may increase in future under pressure of such important requirements as compactness and interchangeability. Particularly urgent in the case of the commercial vehicle, whether of the passenger or merchandise pattern, these two factors are causing designers no little deep thought. Despite the well rooted popularity of the vertical engine at the present time, the industry still is in sufficiently flexible condition to welcome and to adopt without serious difficulty any other type which possesses sufficient merit to warrant its existence. Good evidence of this is furnished in the wide use of the horizontal opposed form of engine in small pleasure cars and the lighter commercials.

The peculiar merits of the V-type of engine, summed up in a few words, are that it is practically only half as long as a vertical engine of the same number of cylinders.

ders; that in the 90-degree form it is susceptible to almost perfect balance; that its valve mechanism and all auxiliaries can be mounted over the center of the crank case and hence in the most perfectly accessible position; that the arrangement thus permitted frees its exterior of encumbrances tending to interfere with the process of mounting and demounting from the chassis; that it may be secured to the frame readily without interfering with the natural form of the latter or necessitating the deformation of the bonnet in order to enclose protruding cylinder heads, as sometimes is necessary with the horizontal type of engine.

In weight, manufacturing cost, economy and flexibility, it should be about equal to the present standard of construction. In the matter of lubrication, it should be intermediate between the horizontal and vertical types, insofar as the oiling of the cylinder walls alone is concerned; ignition should present no difficulties, while in the matter of carburation some advantage should result from the close grouping of the cylinders.

At present the pleasure car field in no wise demands a shortening in engine length, which is one of the principal advantages of the V-type. Save in the case of one or two makes of eight cylinder engine, which otherwise would be inordinately long, this form of engine practically is unknown at the present time. Nevertheless, wherever applied, in large engines of the marine type, as well as in automobile work, it is noteworthy that its performance has been thoroughly creditable, especially in racing exploits. One small car builder abroad has produced a runabout driven by a twin V engine, which is said to have given a very good account of itself and which also has the reputation of being remarkably smooth running.

For commercial vehicle service, especially in the case of the motor cab and the light delivery wagon, the importance of space economy is very great, while it is not practicable in many instances to place the engine under the driver's seat. While this is possible with the opposed form of engine, the resulting arrangement by no means is as convenient as where the engine is carried in front, nor does it invariably permit as advantageous an arrangement of the transmission mechanism. Particularly in the case of the motor cab, it is noteworthy that the use of the V form permits a four-cylinder

## COMING EVENTS

May 27, 28 and 30, Indianapolis, Ind.—Grand Circuit meeting and national championship races on Motor Speedway.

May 27-31, Washington, D. C.—Washington "Post" five days endurance run to Richmond, Va., and return.

May 28, White Plains, N. Y.—Amateur Automobile Contest Association's hillclimb.

May 28 and 30, Kansas City, Mo.—Automobile Club of Kansas City's two days' race meet at Elm Ridge track.

May 28-31, Syracuse, N. Y.—Central New York inter-club relay run.

May 29-30, San Francisco, Cal.—San Francisco Motor Club's two days race meet at Tanforan.

May 30, Bridgeport, Conn.—Bridgeport Automobile Dealers' Association's hillclimb on Snake hill, Fairfield.

May 30, Denver, Colo.—Denver Motor Club's road race.

May 30, Oklahoma City, Okla.—Start of Oklahoma State Automobile Association's six days' reliability contest for "Daily Oklahoman" cup; 800 miles.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 2, New York City.—Annual Orphan's Day outing at Coney Island.

June 3-4, Buffalo, N. Y.—Automobile races at Fort Erie track.

June 4, St. Louis, Mo.—Automobile Club of St. Louis reliability contest.

June 4, Portland, Me.—Portland "Telegram" hillclimb on Morrison hill, West Cumberland.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

June 4, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 6, Atlanta, Ga.—Start of second annual New York-Atlanta Good Roads Tour, ending in New York June 14.

June 6-9, Richmond, Va.—Richmond "Times-Dispatch" endurance run to Raleigh, N. C., and return; 420 miles.

June 7, West Haven, Conn.—Yale Automobile Club's third annual hill-climb on Shingle hill.

June 11, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair.

June 14-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's race meet on Wildwood Speedway.

July 18-22, Milwaukee, Wis.—Wisconsin Automobile Association's first annual endurance test for "Milwaukee Sentinel" trophy.

July 30, Wildwood, N. J.—North Wildwood Automobile Club's race meet on Wildwood Speedway.

August 3-5, Galveston, Tex.—Galveston Automobile Club's beach races.

August 6, Philadelphia, Pa.—Quaker City Motor Clubs' race meet at Point Breeze track.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

August 15, Washington, D. C.—Start of second annual Frank A. Munsey reliability contest.

September 5, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

September 10, San Francisco, Cal.—Automobile Club of California's road race in Golden Gate Park.

September 17, Syracuse, N. Y.—Automobile Club of Syracuse-Syracuse Automobile Dealers' Association joint racemeet at Fair Grounds track.

October 1, Mineola, L. I.—Sixth annual Vanderbilt Cup race on Long Island Motor Parkway, under the auspices of the Motor Cups Holding Co.

October 15, Mineola, L. I.—Motor Cups Holding Co., 278 miles international road race on Motor Parkway, for the Grand Prize of the Automobile Club of America.

engine to go into a length of bonnet which otherwise would be suitable only for a twin. This, in a casual way of thinking, should

furnish a telling argument in favor of the engine for use where space is at a premium.

## WAGNER GETS ONLY CLEAN SCORE

Pilots Native Car to Victory in the All-Connecticut Contest—Technical Examination Decided the Award.

Successfully upholding the honor of its native city and state in the first contest of the season in which it has participated, a 1910 Columbia car, driven by G. M. Wagner, was the only one of 21 contestants to emerge from the Automobile Club of Hartford's 600 miles All-Connecticut reliability run on the 19th to 21st inst. with a perfect road and technical score. The performance of the winning car is all the more

taxed three points for the delay. Up to that time he had no demerits and later passed the technical examination unsullied. Close on the heels of Rantz for place came Fred Reid in a National, who also ran dry of the Rockefeller fluid and, in addition, adjusted his clutch, all of which cost him four points. A remarkable fact was that all of the 21 starters finished the contest, and 20 of them took the final examination, the sole absentee being "Billy" Knipper in the Chalmers.

The contest was the most ambitious undertaking ever engineered by the Nutmeg State club, and, as its name implies, practically covered the entire state, touching 150 of the 168 cities and towns therein. Hartford was the starting and finishing

ton, the noon stop, Bristol, Collinsville and Tariffville.

Heavy rain on the day previous made the roads very muddy and the going hard, and as a result intermediate and low gears were in frequent use. An unusually high wind, which attained its greatest velocity near East Hartland, also retarded progress considerably, but it was not an ill wind, for it benefited everybody by drying up the roads rapidly. Despite the bad condition of the roads, fast time was made and Torrington, the noon stop, was reached by the leaders nearly an hour ahead of time. The early birds waited outside the control with their engines running, until it was time to check in.

So rapidly did the roads dry that the afternoon run was through clouds of dust, and the going was so good that most of the cars loafed to avoid checking in hours ahead of time. Many of the contestants suffered minor penalizations, the most unfortunate being J. F. Cogswell in a Cartercar, who ran out of gasoline in an out of the way place and lost an hour and three-quarters getting a fresh supply. Charles S. Lee in a Franklin, after having a clean record all day, ran out of gasoline within a few feet of the night control. Eight cars completed the day's run with clean sheets, as follows: D. Rankin, Chalmers; C. S. Carris, Franklin; F. A. Rantz, Speedwell; E. L. Nock, Lexington; G. M. Wagner, Columbia; H. F. Earl, Auburn; A. E. Kilby, Jackson, H. B. Gates, Overland.

Friday's run of 203 miles embraced the southeastern section of the state, through a thickly populous district, and was more in the nature of a pleasure jaunt than an endurance test. Fine weather prevailed and, except for a few bad stretches, the roads were ideal. On the outward run the cars passed through Meriden, Waterbury, Danbury and Stamford, where the turn-about was made and the homeward run begun, Bridgeport being the noon stop. Leaving the Park City, the cars followed the shore road to Saybrook and then turned north, following the west bank of the Connecticut river to Hartford. As might be expected, the penalties inflicted were small, but three of the honor men of the first day—Rankin, Chalmers; Kilby, Jackson; and Gates, Overland—fell from grace. The other five—Carris, Rantz, Nock, Wagner and Earl—preserved their scores and had for company J. F. Cogswell, Cartercar; W. S. Williamson, Cartercar; Fred T. Reid, National; H. Y. Ensign, Inter-State; G. S. McCutcheon, National, and S. A. Foster, Rambler, all of whom were assessed on the first day.

Rain fell heavily Friday night, and when the contestants awoke Saturday morning and heard the pattering drops there were many fears for what the day would bring forth, especially for those with perfect scores. When starting time arrived the rain practically had stopped and the faint-hearted ones screwed up their courage a notch or

G. M. WAGNER WITH HIS PERFECT SCORE COLUMBIA

creditable in view of the fact that it was Wagner's first road contest. Three other cars—a Franklin, an Auburn and a Lexington—also went through the three days' running without penalization, but were unable successfully to withstand the searching ordeal of the technical committee at the completion of the contest.

C. S. Carris, at the wheel of a Franklin, whose string of perfect performances in a host of previous contests have earned for him the sobriquet of "Clean Score" Carris, came within an ace of tying the winner. After surviving the road test—clean, mathematically, if not in appearance, and likewise passing the final operative trials successfully, he suffered a penalization of one point for a loose oiler nut on the technical examination. Although shutting him out of the 100 per cent. column, this slight penalty does not, however, detract from Carris's excellent all-around performance.

Fate also shattered the chances of F. A. Rantz in the Speedwell to finish in the honor class. During the hard going of the third day he ran out of gasoline and was

point of the daily runs, which embraced different territory and approximated 200 miles. The enthusiasm engendered by the contest was remarkable and cannot well fail to have a beneficial effect on the sport in that section. In Hartford the contest was a formidable rival of Halley's comet as a popular topic of interest, and in the other cities and towns large crowds were on hand to greet the tourists. In the rural districts schools were dismissed and the children lined up by the roadside and waved flags and cheered as the cars passed.

On Thursday, 19th, promptly at 6 a. m., the first contestant to start, Dean Rankin at the wheel of a Chalmers, received the word and sped away from the club headquarters on Allyn street in a cloud of smoke. The other cars followed at one-minute intervals, and in less than half an hour the last car had been despatched. The route lay through the northwest section of the state and embraced a rugged and mountainous territory, the distance being 207 miles. Some of the larger towns en route were Windsor, Winsted, Canaan, Torrington,

W. R. COUGHTRY CONSULTING A STANDARD OIL DISPENSER

WHERE THE GOING WAS SMOOTH AND EASY

two. Before the start President Speare of the A. A. A., who acted as referee, ordered all the drivers to put chains on their tires to reduce the liability of skidding on the muddy roads. Although the distance—191 miles—was the shortest day's run of the contest, it also was the hardest, owing to the bad roads. The course lay through the eastern half of the state and touched at New London, Norwich, Putnam and Rockville.

To prevent the racing and waiting outside controls which was done on the previous days, Referee Speare sent a pace-making car, a Pope-Hartford, carrying President Gillette of the Hartford club, to head the procession. The penalty for passing the pacemaker, except in case of its disablement, was disqualification, and none of the contestants incurred it. This day's run was productive of what narrowly escaped being a fatality when J. F. Cogswell, Cartercar, crashed through the gates of a railroad crossing in Danielson and a train just grazed the tonneau of the car. Of the five who started with unblemished scores four—Carris, Wagner, Nock and Earl—preserved theirs and Rantz in the Speedwell was the unfortunate one to soil

his record by running out of gasoline. Immediately after the cars checked at Hartford they were submitted to a clutch, brake and gear test, and this was followed by a technical examination. So rigid was this scrutiny that it was well towards Sunday morning when the last car was passed. The results are given in the table:

Class 2—Cars listing between \$801-1,200.		Penalizations.		
Driver and Car.		R'd.	T'cl.	T'l.
H. B. Gates, Overland.....	15	1	16

#### Bay State Snuffs Out Lights Bill.

After numerous attempts to secure its passage, that hardy perennial, the universal lights bill, which was introduced in the Massachusetts legislature some months since, has gone the way of all its predecessors. After being reported favorably, by the committee on roads and bridges and subsequently passed by the House with small dissent, the "poor farmer" and horse owners generally "got busy," with the result that the bill was killed in the Senate without a roll-call.

#### Perkins Heads the Memphis Club.

The Memphis (Tenn.) Automobile Club has been reorganized and a new board of governors elected, as follows: N. C. Perkins, president; S. B. Anderson, S. T. Carnes, Joseph Newberger, T. L. Ballard, Dr. D. M. Hall. A salaried secretary will be employed to give his entire time to the club's affairs.

WATCHERS ON ONE OF THE MANY HILLS

CARS ARRIVING AT HARTFORD AT END OF CONTEST

**JOHNSON WINS CHICAGO FUEL TEST**

**Drives 36 Horsepower Car 185 Miles with 1036 Ounces of Gasolene—Only Nine Entrants Appear.**

Stripped of much of the glory and prestige which attached to its predecessors, the Chicago Motor Club's twice postponed annual fuel economy test finally was staged on Thursday, 19th, with but nine of the original fourteen entrants participating. The course was to Lake Geneva, Wis., and return via the famous Algonquin hills, and totalled 185 miles. According to the formula evolved by the club and which determined the score of the contestants, William A. Johnson, driving a Cole "30" with full passenger complement, made the best showing, although his average mileage per gallon was not the highest. Johnson's car weighed 2,950 pounds loaded, and he averaged 23.6 miles per gallon of gasolene, using for the run 1,036 ounces of fuel, an ounce being equivalent to one-sixteenth of a pint.

Second honors went to the Hudson, driven by James Levy, which converted each gallon of gasolene used into 21.34 odometer miles. The car's loaded weight was 2,780 pounds and it required 1,146 ounces of fuel for the run. A. G. Schillo, Overland, although carrying much less weight than the Hudson, was more extravagant of fuel, and consumed gasolene at the rate of one gallon to every 17.09 miles. Its rating of 1,195 gave it third place. Only six of the nine starters finished. E. C. Haynes, Henry, and Jack Bender, Knox, both withdrew, the latter after using up all his spare inner tubes. H. E. Halbert's Grout, on its performance of 14.5 miles per gallon, would have been entitled to third place had it been able to finish the contest within the prescribed time, but it came in an hour and a half late, owing to transmission trouble. Although the little Hupmobile driven by E. A. Hearne was the most economical performer with 25.8 miles per gallon, its exceedingly light weight affected its standing under the formula and fifth place was its portion.

The course was selected with a view to variety, and while the roads were good the greater part of the way the cars also encountered some sand, a little mud and some "hills," as hills go in that nearly horizontal section, the Algonquin "humps" being the most formidable. It was fortunate that other troubles than economy did

not entail penalizations, for practically all the cars encountered mechanical trouble of one sort or another. The Hudson broke a right spring, and the Overland followed suit with a left one, topping this off with tire trouble. Another spring sufferer was the Fal car, and the DeTamble had a choked feed line.

Under the formula, a premium was placed on weight, and the small cars were handicapped to equalize their weight advantage. The formula consisted of the weight of the car (with passengers) divided by the quantity of gasolene consumed as expressed in ounces, which placed all on an equal competitive basis, the formula being calculated to disclose engine efficiency. The cars competed under the American Automobile Association's price classification, and in addition to the trophy awarded to the winner the class winners received certificates. The competing cars practically all were in the medium priced class as compared with the high priced, high powered machines which competed in former years, and the scant support which the trade gave to the affair was evidenced by the withdrawal of five cars at almost the last minute, various excuses being advanced for the action. It made it appear that few of them were anxious to test the "thirst" of their cars.

The results of the contest are shown by the subjoined table.

**Merrill and Shutcliffe Share Honors.**

Automobile racing evidently is in high favor with the residents of Shenandoah, Ia., and vicinity, for the first racemeet ever held there, which took place on Thursday, 12th inst., was attended by over 7,000 persons, many of whom came from out of town. Over 300 cars were parked at the track. Although a large field competed, the spoils were gobbled up by Merrill in a National and Shutcliffe with a Mason, each of whom corraled two races. While the times made were slow, the events were exciting and closely contested and aroused much enthusiasm.

**The summaries:**

Five miles open for gasolene cars—Won by Merrill, National; second, Wainwright, E-M-F. Time, 6:07¼.

Two miles free-for-all—Won by Shutcliffe, Mason; second, Merrill, National. Time, 2:42.

Five miles for cars rated at 25 horsepower and under—Won by Shutcliffe, Mason; second, Bruner, Hudson. Time, 6:04¼.

Ten miles free-for-all—Won by Merrill, National; second, Shutcliffe, Mason. Time, 12:34¼.

**THREE DAYS RACING AT SAN JOSE**

**Murray Wins Eight Events, Including the Whoop-la Race—One Spectacular Spill, but Without Unhappy Results.**

Three days of automobile and motorcycle racing formed the feature of the annual Rose Carnival at San Jose, Cal., on the 13th, 14th and 15th inst., and was productive of close finishes and fast time, although no records were broken.

On Friday, 13th, the opening day, in the 451-600 stock chassis race, John McDonald in a Winton, while rounding a turn in the second mile, had a tire explode and the car shot through the outer fence. Both men were thrown clear of the machine and escaped with severe bruises. The race was stopped in the fourth mile.

**The summaries:****Friday—May 13th.**

Five miles stock chassis, 230 cubic inches and under—Won by Ruddell, Ford; second, Dennis, Buick. Time, 5:58¾.

Five miles stock chassis, 231-450 cubic inches—Won by Murray, Buick; second, King, Maxwell; third, Warren, Matheson. Time, 5:15¾.

Five miles stock chassis, 451 cubic inches and over—Stopped in fourth mile on account of accident. King, Maxwell, leading.

Five miles free-for-all, Santa Clara County owners—Won by Warren, Matheson; second, Dennis, Buick. Time, 6:27.

**Saturday—May 14th.**

Five miles match, between Ruddell, Ford, and Onthank, Stevens-Duryea—Won by Ruddell. Time, 5:43¾.

Five miles handicap—Won by Murray, Buick; second, King, Maxwell. Time, 5:13¾.

Obstacle race—Won by Murray, Buick. Time, .40½. Distance, 500 yards.

Five miles handicap—Won by King, Maxwell; second, Murray, Buick. Time, 5:00¾.

One mile freak race—Won by Murray, Buick; second, King, Maxwell. Time, 1:23.

**Sunday—May 15th.**

Five miles stock chassis handicap—Won by Murray, Buick; second, King, Maxwell. Time, 4:59¾.

Five miles handicap, open—Won by Murray, Buick; second, tie between King, Maxwell, and Agraz, White; third, Warren, Matheson. Time, 5:22.

Five miles match, between Warren, Matheson, and Ruddell, Ford, not finished. Ruddell quit in first lap and Warren in second.

Obstacle race for cars with 115-inch wheelbase or under—Won by Murray, Buick; second, Holman, Maxwell; third, King, Maxwell. Time, 0:43.

Whoop-la race, same as obstacle race—Won by Murray, Buick. Time, 0:43¾.

## HIS WAY OF BEATING THE TAXICABS

**It Required a Physician's Services, but he Cheerfully Paid His Price—and Saved Money, Too.**

A motor car version has been given to one of the humorous classics of the medical profession, and in its new form is serving to put automobile-owning physicians more or less on their guard, while at the same time it strikes a responsive chord in the breasts of those who have suffered from the "buzz-saw" rapidity of some taximeters. The story, as narrated in automobile circles, is as follows:

Having dallied in Manhattan's "white light" district until long past midnight, a well-to-do Jerseyman emerged from a Broadway "lobster palace" and asked the taximeter cab starter as to how much it would cost for a motor cab trip to his New Jersey home, situated in the "private estate" suburban district, some twelve miles out from Jersey City. The starter said that the trip would cost about \$30, whereat the Jerseyman, although well mellowed by his evening's entertainment, decided that he would take the subway "tube" to Jersey City, and perhaps engage a cab there.

In Jersey City he negotiated quarrelsome with a taximeter cab driver, but the latter refused to guarantee that the taximeter charge for the suburban run would be less than \$15. The Jerseyite then dropped in at a club, took several more supports for his courage and then headed homeward on foot, there being no trains or trolleys available. In his uncertain progress he discovered the night light burning brightly in front of a physician's house, so he rang the bell and asked the doctor, whom he knew by reputation, to come on a sick call. The physician dressed hurriedly, cranked his machine in the private garage in the back yard and was soon on the high road with the Jerseyman, on the way to the latter's home. As they drew up before the residence, after a quick run, the Jerseyman asked thickly what the doctor's charge was for a sick call at night, and the latter named his usual \$5 fee.

"Well, here's your money," said the Jerseyman, "and I'm much obliged to you, because that taximeter robber wanted to soak me \$15 for this trip. Good night, ol' man, and a safe trip home."

### Where the Black Man Bears no Burden.

How to support a whole town on the fines assessed on motorists, is a problem which has been solved successfully by the little negro town of Brooklyn, Ill. The officials of this town have found a prolific source of revenue and a good deal of private profit in arresting automobile drivers and running up fines and witness fees, particularly the

latter. Pleas of guilty are not wanted by the negro judge and the officials of the Brooklyn court. Instead, they insist on hearing witnesses, numbering the greater part of the town's male population. Then each one of the witnesses gets 60 cents, and this money, along with the regular fine and costs, must be paid by the unlucky motorist. All the expenses of the town are met by these fines and costs, while the majority of the people, it is said, do not have to work as long as enough automobiles pass through and pay them 60 cents for every time they go to court.

### The Downfall of Atlanta's Police.

One of the most amusing accidents that ever happened to an automobile occurred recently at Atlanta, Ga. The Atlanta Police Department possesses a new automobile patrol wagon provided with a long rear step on which the arresting officers ride when there is no room inside the vehicle. On this particular ride five extremely heavy officers conveyed a batch of prisoners to the station, and, as luck would have it, the step gave way at the moment the car entered the driveway to the station yard. The five officers landed in a heap on the pavement, while the prisoners made a rush for liberty. Although none of the policemen was badly hurt, and none of the prisoners succeeded in escaping, the order has gone forth that no more than one policeman at a time will be permitted to ride on the back step.

### Tall Argument Against Prohibition.

Probably the oddest argument against local option that has yet been advanced emanates from Rochester, a town in Michigan, 25 miles from Detroit. Rochester is in Oakland County, which went "dry" two years ago and "wet" this spring. Motorists who have occasion to pass through Rochester are rejoicing, because they say in the days of the "dry" wave they cut their tires all to pieces by running over empty whiskey flasks and broken beer bottles. Now that these "liquids" are sold by the glass in regular retail stores (i. e., bars), bottles are rarely met with on the streets and roads.

### "Fill 'em up" Policy Encounters Objection.

The experiment of the Chicago Automobile Club of filling the gasoline tanks of all cars stored in the club garage, whether or not the owner has ordered it, has been abandoned, because of the objections of some of the members. In the main, however, the innovation met with success, and in order to continue the practice without making it compulsory, the board has given orders that any member who may desire to do so may leave standing orders to have his gasoline tank filled on all occasions when his car enters the garage, without the necessity of giving definite instructions in each case.

## SHOWS THE DANGERS OF GASOLENE

**Expert Makes Startling Tests that Prove the Perils of the Vapor and the Harmlessness of the Fluid.**

Members of the Automobile Club of America were given a peculiar treat recently, when Mr. E. W. Marshall, a patent attorney, lectured before them on the "Safety of Gasolene." Some of the audience were startled when at the outset a lighted match was applied to a can of gasolene. But this, to Mr. Marshall, was simple, as was also the boiling of a can full of gasolene over an open flame.

The experiments were made in order to prove to the audience that, in order to explode gasolene, it must be in the form of vapor mixed with a considerable quantity of air. The lecturer partly filled a coffee pot with gasolene and ignited the vapor at the spout. Some distance away he placed another can filled with gasolene. He then poured the gasolene from the coffee pot through the burning vapor at the spout into the can at its side. Although the spectators shuddered, nothing happened.

Following these proofs of the safety of gasolene vapor when pure and unmixed with air came experiments showing the danger of the same when permitted to mingle with certain quantities of air. Mr. Marshall filled a large paper bag with air and then, by the use of an ordinary atomizer, saturated the air with vapor of gasolene. Inserting a spark plug attached to a battery, he caused an instant and heavy explosion.

In the second part of the lecture Mr. Marshall proved that all of the slow burning explosives are harmless when not under pressure by burning smokeless powder and lighting his cigar with the burning stick of powder. He also showed how to make a carburettor out of his cigar by smoking one with gasolene in it and igniting the mixture of smoke, air and vapor as it issued from his mouth. He then thoroughly saturated the cigar with gasolene and continued to smoke it, thus proving that gasolene cannot be ignited by the embers of a cigar.

Gasolene in various mixtures with air was exploded by several different methods, the speaker pointing out the need of great care in preventing the escape of gasolene vapor into a room where it could become mixed with a large quantity of air, because only a small quantity of gasolene vapor is needed to make an explosive mixture of the atmosphere in a good sized room.

### Tennesseans Organize for Road Reform.

Automobilists of Dyersburg, Tenn., have formed an automobile club and elected S. G. Latta treasurer. The organization will devote its efforts to securing road improvement in the territory.

## NO CLEAN SCORES AT MORRISTOWN

All of the 55 Starters Survived but None Escaped Penalty—Strenuous Travel Over Pennsylvania Mountains.

Had the starters in the Norristown (Pa.) Automobile Club's third annual endurance run of 327 miles to Scranton and return on the 18th and 19th inst. realized beforehand the road conditions which they would have to face, it is highly probable that the function would not have attracted a record entry of 55 nominations. Officials and contestants are agreed that it was a most strenuous test of both men and machines, and

technical end, and C. C. Fairlamb with a Klinekar accounted for class D. His score sheets carried an endorsement of 70 points. What, with its winning of the runabout class, was in the nature of a twin triumph for the Pullman was its capturing of the Gallagher trophy offered for the first car to reach Scranton with a perfect road score. Herbert Bittner drove the winner. Surprising as it may seem, all of the starters checked in at the finish, but did not take the technical examination, several being satisfied to withdraw upon the completion of the road tests.

On Wednesday morning, 18th, Halley's comet ceased to be the center of attraction in Norristown, temporarily, at least, and the start of the run occupied the center of

trols. Particularly bad was the going from Pottsville to Hazleton, and the Wilkes-Barre stretch was not much better. Considering the racking that the cars received, it is surprising that so many emerged from the technical ordeal with such a good showing.

There were two accidents during the day, one of which narrowly escaped having a fatal termination. Near Wilkes-Barre, while George Parker's Palmer-Singer was devouring a curve at high speed, a tire collapsed and the car lurched towards a bridge which spanned a deep ravine. It struck a concrete post with terrific force and all of the occupants were spilled out. Fortunately none were injured, and the car also escaped serious damage, but it was withdrawn from the run. The other mishap occurred near

MORE EVIDENCE OF STRENUOUS TRAVEL

ROUGH GOING IN THE MOUNTAINS

the wonder is not that there was not a single perfect score, but that the penalties were so few, in view of the adverse conditions which had to be overcome.

Scoring a most signal double victory in competition with a representative field, the Selden car made a most excellent showing and surprised the wisecracks. It was in the manufacturers' division, class A, that Henry Young drove a Selden to victory, incurring a total penalization of 38 points, as against 44 for his nearest competitor. The other laurel wreath which was corralled by "the father of them all" was plucked in the members' division, when Fred Dyer, at the wheel of the Rochester product, headed the list, and won his class by a big margin, with a penalization of only 2 points.

Not all of the spoils went to the Selden car, however, for Pennsylvania built cars were well represented in the apportionment of the remainder. In Class B, H. E. Walls and a Maxwell were the honor team, with an assessment of but 26 points, all of which were incurred in the technical examination, the car making a perfect road score. Its demerits also were the lowest of any class winner in the manufacturers' division. In the runabout division H. P. Hardesty piloted a Pullman to victory in class C, incurring total penalties of 49 points on the

stage. There was a large crowd on hand at the Hotel Montgomery to see the start at 7 a. m., the cars being dispatched at minute intervals. In the manufacturers' and agents' divisions there were 43 contestants, the remainder comprising the members' class. The distance to Scranton was 151 miles, and there were four checking stations on the way—at Reading, Pottsville, Hazleton and Wilkes-Barre, respectively. It was fortunate that the contestants got their hard going on the first day, while both men and cars were fresh and strong, otherwise the mathematical mortality undoubtedly would have been much greater. An innovation introduced by the club, and which well may be copied by others was the scattering through the countryside of printed circulars giving a detailed list of the competing and official cars and their numbers. This forethought enabled the local populace to identify the cars as they passed, and enlivened the interest in the event.

Heavy rains on the previous night converted the roads into quagmires, and tire trouble was the rule. The pull over the mountains which necessitated the frequent use of the intermediate and low gears, also told on the cars and was responsible for many overheated engines and tardiness at con-

West Scranton, when J. A. Kline in a Klinekar ran down a boy named Enoch James. At Scranton Kline was detained until he had deposited \$1,000 bail for his appearance later.

As previously told, Bittner in his Pullman, by a superb exhibition of driving was the first to check in at Scranton with a clean road score. Only seven others in the manufacturers' division had this proud distinction, as follows: John Burns, Franklin; R. L. Morton, Klinekar; H. E. Walls, Maxwell; Edward Wilkie, Buick; W. G. Dyer, Premier; H. P. Hardesty, Pullman, and J. A. Kline, Klinekar. None of the contestants in the members' division came through the first day with spotless tally sheets. Despite their strenuous day's work, the visitors made merry during the evening as guests of the Scranton Automobile Association.

Although the homeward run on the second day was longer—176 miles—the extra distance was amply compensated for by the excellent roads which were encountered. As on the previous day, there were four intermediate checking stations, which were located at Stroudsburg, Easton, Allentown and Philadelphia, the stretch between the last two cities being the longest. Weather and roads were ideal, and the tourists were

greeted by large crowds all along the route. Schools were dismissed and the children cheered the flying cars as they flashed by. As on the first day, Bitner and his Pullman again led the van at the final control, and had there been another prize for the homeward run he would have captured it. To what degree the roads surpassed those on the first day is amply indicated by the score of cars which completed the second leg with clean road records.

The sole accident of the second day was the spilling from the rear of Detwiler's Overland of Chris Meeh, one of the checkers, who was riding on the rear box. The mishap occurred while rounding a curve on the Germantown pike, but Meeh was not injured seriously. Following the arrival

singular sounds by reason of his efforts in support of an amendment to the pending automobile bill in connection with the clause requiring the use of horns of the reed variety exclusively. The added clause carries the stipulation: "Provided, that no horn shall be sounded so as to produce an unreasonable or obnoxious noise." After this amendment had been added to the bill it was passed to be engrossed.

#### Entry Fees that Included Insurance.

Participants in the international reliability trials held in Germany from May 1st to May 5th, over the Berlin-Rothenburg course were insured against all possible accidents. The entry fee included premiums for insurance against death or damages

IN ONE OF THE MOUNTAIN TOWNS

THE VALE ROAD NEAR HAZLETON

of the cars at Norristown, they were placed under guard in garages to await the technical examination. Owing to the large number of cars and the fact that the several brake, gear and clutch tests were conducted in different parts of the city, the technical committee required two days to complete their work.

The results are given below:

Manufacturers' Division No. 1.

#### Moving on the Long Island Bonifaces.

Having paid his annual call on the New Jersey hotel-keepers, with a train of motorists under his wing, the Motor Contest Association now is preparing to round up another party which he will guide on the usual visit to the bonifaces on Long Island. The "association" has fixed June 14th and 15th as the dates for the visit, which, of course, he styles a reliability contest. The route will be from New York to Montauk Point and return. What is called a "pathfinder" will go over the road to effect the "usual arrangements."

#### Massachusetts Specifies Reed Horns.

For the benefit of those who have been unable to distinguish one variety of motor horn from another, Representative Isaac E. Willets, of the Massachusetts legislature, has thoughtfully provided a triple classification. Horns may be, he says, either plain "honk-honks," of the German band variety or regular "hell-raisers." Representative Willets was moved to this segregation of

caused by drivers of the competing cars, in amounts not exceeding 50,000 marks for the death or damage to a single person, and not exceeding 150,000 marks in case of a catastrophe in which more than one person lost their lives. This insurance started at the moment the car passed the starting line and ceased automatically the instant the finishing line was reached. Drivers could not collect any damages to themselves under this arrangement, but could insure themselves against accident at the starting line, for which purpose agents of the principal insurance companies were present when the cars were lined up. Superstitious persons ought to have dropped out of that race, for not only was the number of participating manufacturers exactly 13, but in each of the three sections there were thirteen starters.

#### Port Jefferson Climb Details.

Entry blanks are out for the first annual hill climb of the Automobile Club of Port Jefferson, L. I., which will be held on Saturday, June 25th, under A. A. A. rules and sanction. The program consists of 15 events and the festivities will begin at 10 a. m. The hill is 2,000 feet in length, with a maximum grade of 15 per cent. and an average of 10, and contesting cars will be allowed a take-off of 400 feet in tackling the incline.

## SPORT MINUS THE DOLLAR SIGN

It Proved Rather Picnicish but the Amateurs Cared Not—How the Long Islands Walloped the Crescents.

While there is no doubt that it fully met the anticipations of some of the participants, the challenge endurance contest between teams of 15 representing the Long Island Automobile Club and the Crescent Athletic Club of Brooklyn, N. Y., was not quite up to the standard which had been fixed by some of those who fancied it would mark

it was designed that the contest should not be made strenuous or be taken too seriously, and it was at Blue Point that the first elements of the "good time," which had been projected, entered into the affair. The spread was served under the trees, all being seated on planks supported by beer kegs. After the siphon process had been indulged in to a reasonable degree, two members of the committee mounted the curious concrete protuberance bearing Egyptian hieroglyphics in "Bill" Graham's front yard and attempted conversation, but were snuffed out by a chorus of horns.

The check-out on the noon control occurred at 1.30 p. m. Patchogue, Bellport,

THE LUNCHEON IN THE GROVE AT BLUE POINT

ONE OF THE EFFECTS OF THE LUNCHEON

a beginning of real amateurism and wholesome club rivalry in automobile sport in which the dollar sign would be obscured. The dollar sign happily remained out of sight, but the competitive features were more apparent than real.

The contest, which occurred on Saturday and Sunday last, 21st and 22d inst., was won by the Long Island club, which will retain the Pardington trophy until next year's affair; it must be won twice to insure permanent possession. With a fine regard for something or other or someone or other, it was officially announced that the Long Islands had earned the victory "by an average of 9 to 11½ points per-car," which works out at about 135 to 175 debits. As a number of cars are known to have finished with clean scores, the announced result makes plain that there were others which suffered heavy penalties.

The start was made from Prospect Park plaza in Brooklyn at 8:30 o'clock Saturday morning, the teams being composed as follows:

S. B. Stevens was referee and F. G. Webb, the A. A. A. representative, but it appeared to make no difference whether the contestants were registered in accordance with the A. A. A. rules or that at least seven of them are guilty of the horribly unsportsmanlike offence of being engaged in the automobile trade and therefore could be registered only as professionals. No questions were asked.

The first day's route was from Brooklyn to Riverhead, 140 miles, via Freeport and Babylon, etc., and with the luncheon stop at Blue Point. In snuffing the dollar sign,

Left, Right, Middle, Top, Bottom, Upper, Lower and other intermediate Moriches, Eastport, Speonk, Quogue, Westhampton, Bridgehampton, Easthampton, Southampton, Shinnecock Hills and all the rest were passed through in the rounabout journey to Riverhead, which was reached at 6 p. m. after an afternoon's run of 86.5 miles—a longer drive than Judge Horace Russell of New York could make with any one of his golf clubs, as the motorists informed him in crossing the Shinnecock links.

At Riverhead the opposing forces were quartered at different hotels and the committee in a third house, at the earnest request of the Universal Peace Society. There was another "good time" and a much longer one in the Auditorium, where a smoker was held. The programs were a combination chromo-valentine. There were soubrettes, musical mokes and other things, and "suds" were passed on a tray, and more than one bottle had its neck wrung. A. R. Pardington and "good old" John C. Wetmore, who were "among those present," ended the bill with a brother act, "The Piano movers." Wetmore's happiest thought was: "What's an amateurs schedule when

IN THE SHINNECOCK HILLS COUNTRY

NEARING PATCHOGUE ON FIRST DAY'S RUN

you want a drink?" while Pardington declared he hadn't played a part for nine years, he had been so busy "starting something" for others.

At 10 o'clock all the window shades in the Auditorium had to be lowered by native edict, lest the festivities interfere with the preparation for the Long Island Sabbath. Adjournment finally was taken to the weekly dance at the town hall which proved too small. More room was accordingly secured by pushing out a window; then all seemed happy until 4 a. m., when the oil in the lamps gave out.

Starting back from Riverhead at 9 a. m. Sunday, the party ran a 30-mile gauntlet of thrifty speed constables, who cut out morning church services in the expected interest of town treasuries. Their efforts stopped, though, at the point of expectations, for the tourists devised a wireless code of signals with each other. One contestant, by the way, fell over the back end of his car in gesticulating, and another literally was "soused," which is to say he fell into a stream. There was less distance but more surface the second day. Three hills near Wading River proved the chief tests of the trip, while two more at Port Jefferson were noteworthy. The noon control was at Smithtown, where the crowd had a lot of fun with the ram that Kingsley Swan had bought as a mascot from a nearby farmer. His ramship was speedily equipped with goggles, and those who undertook a job of carrying the "critter" 60 miles in a touring car knew they had performed a day's work.

The morning run of 50.7 miles brought plenty of tire trouble, involving no penalty, some of which caught competitors in soft ground where it was difficult to use a jack. Albert Bryant, in consequence, covered 29 miles in 40 minutes and turned a corner at St. James so quickly that he nearly ran down Mayor Gaynor and the latter's dog. Scenically, Smithtown was gorgeous with miles of yellow flowers that looked like scrambled eggs in blossom.

The afternoon journey was through Centerport, Huntington and Jericho to Krug's Corner—48 miles—making 99 miles for the day, against 140 miles on Saturday. Of course, several of the smaller cars had only a reasonable schedule to reach the controls, but the higher powered ones, instead of covering the 240 miles called for, did 30 to 40 miles extra to avoid standing with engines running.

The judges, L. T. Weiss, L. I. A. C., and W. T. Wintringham, C. A. C., lost no time in figuring the results, and in announcing it in such refreshingly novel fashion that anyone who desires to learn how each performer performed is free to make his own guess. There were several protests regarding the stalling of engines and the taking of short cuts, but the judges nevertheless completed their task before midnight. Everyone who started finished, and the contest abundantly proved at least two things, i. e., that the weather was fine and the roads of Long Island are all right, everything considered. Next year, perhaps, there will be observers who are able to

technically "observe"; for while "gentlemen's agreements" are not half-bad they do not fill the bill.

#### Asks Court to Stop Bridgeport Climb.

Fearing that the abnormal automobile traffic which will be directed through the town on that day will be detrimental to the excellent roads which he has constructed at his own expense, Frederick Sturges, a millionaire banker of Fairfield, Conn., has applied for an injunction against the Bridgeport Automobile Dealers' Association to prevent them holding their proposed hill-climb on Snake hill in that town on May 30. Although the contest will not be held on roads built by Sturges, it will be necessary to travel over part of the highways which he has constructed but which are public arteries of travel. His other objections are based on the noise and bustle which will accompany the event and the defacement of the town by the erection of posters advertising it. The dealers are going ahead with their plans.

#### Hundred Miles Added to Grand Prize.

Announcement was made late last week that at a meeting of the Motor Cups Holding Co., which will conduct the Grand Prize race on Long Island on October 15th, that had been decided to lengthen the distance of the race from 278.8 to 379.2 miles—a raise of an extra 100. By this change cars will be required to make 30 circuits of the course instead of 22 as originally scheduled.

CLIMBING THE WADING RIVER HILL

## NEW YORK'S NEW LAW IS ENACTED

Much-Amended Callan Bill Finally is Passed  
and Governor Will Sign it—Full  
Text of Measure.

After several months of conference and retinkering, the New York legislature finally passed the Callan automobile bill on Monday last, and as, in its finally amended form, it previously had been submitted to Governor Hughes and he had let it be known that he would sign it when it reaches him, it is certain that on August 1st next it will replace the present generous law which has been in force so many years and which had resisted so many previous efforts to undo it.

The last hitch in the Callan measure, an interjected clause permitting any village to adopt its own traffic regulations, was smoothed out by the elimination of the objectionable requirement, and in general the law is as fair a one as automobilists may reasonably hope to obtain at this time. The fees imposed are unduly high, but the fines are less rigorous and some other stings of the existing act are either reduced or wholly removed.

For the present system of permanent registration, the law substitutes annual registration which must be renewed on the first day of August of each year. Fees are \$5 for 25 horsepower, or less; \$10 for more than 25 and less than 35 horsepower; \$15 for more than 35 and less than 50 horsepower; \$25 for more than 50 horsepower, A. L. A. M. ratings to govern. Vehicles to be used solely for commercial purposes, \$5. On pleasure cars which have paid the registration fee for four years the fees will be one-half of the specified sums. When an owner sells a car the sale must be reported to the secretary of state. On applications for registration filed after January 1st of this year, a reduction of one-half of the fees will be allowed. Fees will be considered in lieu of taxes, general or local, to which motor vehicles may be subject. Non-residents of only such states as exempt New Yorkers from the provisions of their laws, are exempted by the Callan measure, which means that New Jersey men hereafter must "pay up" and carry New York tags. Number plates, the color of which will be changed annually, must be displayed front and rear.

Manufacturers and dealers will pay \$15 a year for a general registration of all their cars, and \$1 additional for each registration plate affixed to such cars. Cars so marked shall not be operated for private use or for hire.

Cities of the first class—New York, Buffalo and Rochester—may fix their own speed regulations without stint, and while other cities and incorporated villages also

are permitted to make such regulations, they cannot require a speed of less than 15 miles per hour; a greater speed over a distance of one-eighth of a mile will be, however, presumptive evidence of careless driving. Elsewhere the speed must be "careful and prudent," but "a rate in excess of 30 miles an hour for a distance of one-fourth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent." Cities and towns must erect signs showing where their speed limits begin and end..

The chauffeur's license fee is fixed at \$5 annually; his application must be accompanied by his photograph and must be sworn to before a notary public or justice of the peace; he will be provided with a distinctive badge to be worn openly when driving a car; loaning badge to another person, or wearing fictitious badge is punishable by fine of \$50. All chauffeurs must pass an examination and they may be restricted to the operation of a particular type of car.

The progressive or accumulative penalties of the existing law are wiped out by the Callan bill and speed offenses are made "a misdemeanor punishable by a fine not exceeding \$100." Imprisonment and indictment will be no longer possible for such offenses, but one of the late amendments to the law provides that conviction for any offense shall not constitute a bar to a prosecution for an assault or homicide committed by any person in operating a motor vehicle. Chauffeurs—who are defined as persons operating cars "as employees or for hire," which would seem to include salesmen and possibly branch managers as well as professional drivers—may, however, have their licenses revoked for third or subsequent offenses, and owners and chauffeurs alike will have their registrations and license certificates, respectively, revoked for intoxication or for not stopping in case of accident, the latter offense constituting a felony. But such suspension or revocation is conditional on the recommendation of the trial court, thus wisely giving the technical offender a chance for mercy.

The full text of the bill as finally passed is as follows:

Sec. 1. Chapter thirty of the laws of nineteen hundred and nine, entitled "An act relating to highways, constituting chapter twenty-five of the consolidated laws," is hereby amended by repealing article eleven thereof and by inserting therein a new article, to be article eleven thereof, to read as follows:

#### ARTICLE 11. MOTOR VEHICLES.

- Sec. 280. Application of article.  
281. Definitions.  
282. Registration of motor vehicles; age of operator; fees; renewals.  
283. Distinctive numbers; form of number plates.  
284. Registration by manufacturers and dealers; reregistration.  
285. Exemption of nonresident owners.  
286. Signaling and other devices; signals; rules of the road.  
287. Speed permitted.  
288. Local ordinances prohibited.  
289. Registration of chauffeurs; renewals.  
290. Punishment for violation; procedure.  
291. Disposition of registration fees; fines and penalties.

#### 292. Rates of toll on motor vehicles.

#### 293. Acts repealed.

Sec. 280. Application of article. Except as herein otherwise expressly provided, this article shall be exclusively controlling:

1. Upon the registration, numbering and regulation of motor vehicles, and the licensing and the regulation of chauffeurs;
2. On their use of the public highways, and
3. On the accessories used upon motor vehicles and their incidents and the speed of motor vehicles upon the public highways;
4. On the punishment for the violation of any of the provisions of this article.

Sec. 281. Definitions. The term "motor vehicle" as used in this article, except where otherwise expressly provided, shall include all vehicles propelled by any power other than muscular power, except motor bicycles, motor cycles, traction engines, road rollers, fire wagons and engines, police patrol wagons, ambulances and such vehicles as run only upon rails or tracks. The term "local authorities" shall include all officers of counties, cities, boroughs, towns or villages, as well as all boards, committees and other public officials of such counties, cities, boroughs, towns or villages. The term "chauffeur" shall mean any person operating or driving a motor vehicle as an employee or for hire. The term "state" as used in this article, except where otherwise expressly provided, shall also include the territories and the federal districts of the United States. The term "owner" shall also include any person, firm, association or corporation renting a motor vehicle or having the exclusive use thereof, under a lease or otherwise, for a period greater than thirty days. The term "public highway" shall include any highway, county road, state road, public street, avenue, alley, park, parkway or public place in any county, city, borough, town or village, except any speedway which may have been or may be expressly set apart by law for the exclusive use of horses and light carriages.

Sec. 282. Registration of motor vehicles; age of operator; fees; renewals. 1. Registration by owners. Every owner of a motor vehicle which shall be operated or driven upon the public highways of this state shall, except as herein otherwise expressly provided, cause to be filed, by mail or otherwise, in the office of the secretary of state a verified application for registration on a blank to be furnished by the secretary of state for that purpose, containing: (a) A brief description of the motor vehicle to be registered, including the name of the manufacturer and factory number of such vehicle, the character and amount of the motive power stated in figures of horse power in accordance with the rating established by the Association of Licensed Automobile Manufacturers; (b) the name, residence, including county and business address, of the owner of such motor vehicle; (c) provided that, if such motor vehicle is used or to be used solely for commercial purposes, the applicant shall so certify.

2. Age of operator. No person shall operate or drive a motor vehicle who is under eighteen years of age, unless such person is accompanied by a duly licensed chauffeur or the owner of the motor vehicle being operated.

3. Registration book. Upon the receipt of an application for registration of a motor vehicle, as provided in this article, the secretary of state shall file such application in his office and register such motor vehicle or vehicles, with the name, residence and business address of the owner, manufacturer or dealer as the case may be, together with the facts stated in such application, in a book or index to be kept for the purpose, under the distinctive number assigned to such motor vehicle by the secretary of state, which book or index shall be open to public inspection during reasonable business hours.

4. Certificate of registration. Upon the filing of such application and the payment of the fee herein-after provided, the secretary of state shall assign to such motor vehicle a distinctive number and, without expense to the applicant, issue and deliver to the owner a certificate of registration, in such form as the secretary of state shall prescribe, and two number plates. In the event of the loss, mutilation or destruction of any certificate of registration, number plate, license or badge, the owner of a registered motor vehicle or manufacturer, or dealer, or chauffeur, as the case may be, may obtain from the secretary of state a duplicate thereof upon filing in the office of the secretary of state an affidavit showing such fact and the payment of a fee of one dollar.

5. Times for registration and reregistration. Registration applied for on or before August first, nineteen hundred and ten, shall take effect on that date and certificates issued on such application or under any application made prior to January thirty-first, nineteen hundred and eleven, shall expire on the latter date. The fees for such registration shall be one-half of the annual fees provided herein. Registration thereafter shall be renewed annually in the same manner and upon payment of the same annual fee as provided in this section for registration, to take effect on the first day of February in each year beginning with such date in the year nineteen hundred and eleven; and the certificates of registration issued thereunder or issued between any such dates shall expire on the succeeding thirty-first day of January.

6. Registration fees. The following fees shall be paid to the secretary of state upon the registration or reregistration of a motor vehicle in accordance with the provisions of this article: Five dollars upon the registration of a motor vehicle having a rating of twenty-five horsepower or less; ten dollars upon the registration of a motor vehicle having a rating of more than twenty-five horsepower and less than thirty-five horsepower; fifteen dollars upon the regis-

tration of a motor vehicle having a rating of thirty-five horsepower and less than fifty horsepower; twenty-five dollars upon the registration of a motor vehicle having a rating of fifty horsepower or more; provided that if a motor vehicle other than one used solely for commercial purposes shall have been licensed for four separate years hereunder and for which there shall have been paid the annual registration fees herein provided during said period, the annual registration fees thereafter shall be one-half the amount; and further provided that for motor vehicles which are used or to be used solely for commercial purposes, the fee for such registration shall be five dollars.

7. Fees in lieu of taxes. The registration fees imposed by this article upon motor vehicles, other than those of manufacturers and dealers and those used solely for commercial purposes, shall be in lieu of all taxes, general or local, to which motor vehicles may be subject.

8. Sale and registration by vendee. Upon the sale or transfer of a motor vehicle registered in accordance with this section, the vendor shall immediately give notice thereof with the name and residence of the vendee to the secretary of state, and the vendee shall, within ten days after the date of such sale or transfer, notify the secretary of state thereof upon a blank furnished promptly by him for that purpose, stating the name and business address of the previous owner, if known, the number under which such motor vehicle is registered and the name, residence, including county and business address, of the vendee. Upon filing such statement duly verified such vendee shall pay to the secretary of state a fee of one dollar, and upon receipt of such statement and fee the secretary of state shall file such statement in his office and note upon the registration book or index such change in ownership.

9. Upon the sale of a motor vehicle by the manufacturer or dealer the vendee shall be allowed to operate the same upon the public highways for a period of fifteen days after taking possession thereof or until he shall have received his certificate of registration and number plates from the secretary of state, providing that during such period the motor vehicle shall have attached thereto, in accordance with the provisions hereof, a placard bearing the registration number of the dealer under which it might previously have been operated, and provided further, that application for registration shall be made by mail or otherwise before such vehicle shall be so used.

Sec. 283. Distinctive number; form of number plates. 1. Distinctive number must be carried on motor vehicles. No person shall operate or drive a motor vehicle on the public highways of this state after the first day of August, nineteen hundred and ten, unless such vehicle shall have a distinctive number assigned to it by the secretary of state and a number plate with a number corresponding to that of the certificate of registration conspicuously displayed, one on the front and one on the rear of such vehicle, each securely fastened so as to prevent the same from swinging.

2. Number plates to be changed annually. Such number plates shall be of a distinctly different color each year, and there shall be at all times a marked contrast between the color of the number plates and that of the numerals or letters thereon.

3. Form of number plate. Such number plate shall be of metal, at least six inches wide and not less than fifteen inches in length, on which there shall be the initials "N. Y.," and there shall be the distinctive number assigned to the vehicle set forth in numerals four inches long, each stroke of which shall be at least five-eighths of an inch in width; provided that in the case of a motor vehicle registered by a manufacturer or dealer there shall be on such plate in addition to the foregoing the letter "M," each stroke of such letter to be at least four inches long and five-eighths of an inch in width. No vehicle shall display the number plates of more than one state at any time.

Sec. 284. Registration by manufacturers and dealers; reregistration. 1. Registration by manufacturers and dealers. Every person, firm, association or corporation manufacturing or dealing in motor vehicles may, instead of registering each motor vehicle so manufactured or dealt in, make a verified application upon a blank to be furnished by the secretary of state for a general distinctive number for all the motor vehicles owned or controlled by such manufacturer or dealer, such application to contain: (a) A brief description of each style or type of motor vehicle manufactured or dealt in by such manufacturer or dealer, including the character of the motor power, the amount of such motor power stated in figures of horsepower in accordance with the rating established by the Association of Licensed Automobile Manufacturers; and (b) the name, residence, including county and business address, of such manufacturer or dealer. On the payment of the registration fee of fifteen dollars such application shall be filed and registered in the office of the secretary of state in the manner provided in section two hundred and eighty-two of this article. There shall thereupon be assigned and issued to such manufacturer or dealer a general distinctive number and without expense to the applicant issued and promptly delivered to such manufacturer or dealer a certificate of registration in such form as the secretary of state shall prescribe, and a number plate with a number corresponding to the number of such certificate of registration. Such number plate or a duplicate thereof shall be displayed by every motor vehicle of such manufacturer or dealer when the same is operated or driven on the public highways. Such manufacturer or dealer may obtain as many duplicates of

such number plates as may be desired upon payment to the secretary of state of one dollar for each duplicate. Nothing in this subdivision shall be construed to apply to a motor vehicle operated by a manufacturer or dealer for private use or for hire.

2. Reregistration annually. Such registration shall be renewed annually in the same manner and on the payment of the same fee as provided in this section for original registration, such renewal to take effect on the first day of February of each year. Provisions of subdivision four of section two hundred and eighty-two, relating to first registrations made under this article and duration of renewals, shall apply to registration under this section.

Sec. 285. Exemption of nonresident owners. The provisions of the foregoing sections relative to registration and display of registration numbers shall not apply to a motor vehicle owned by a nonresident of this state, other than a foreign corporation doing business in this state, provided that the owner thereof shall have complied with the provisions of the law of the foreign country, state, territory or federal district of his residence relative to registration of motor vehicles and the display of registration numbers thereon, and shall conspicuously display his registration numbers as required thereby. The provisions of this section, however, shall be operative as to a motor vehicle owned by a nonresident of this state only to the extent that under the laws of the foreign country, state, territory or federal district of his residence like exemptions and privileges are granted to motor vehicles duly registered under the laws of and owned by residents of this state.

Sec. 286. Signaling and other devices; signals; rules of the road. 1. Brakes, horns and lamps, signaling at crossings. Every motor vehicle, operated or driven upon the public highways of this state, shall be provided with adequate brakes in good working order and sufficient to control such vehicle at all times when the same is in use, and a suitable and adequate bell, horn or other device for signaling, and shall, during the period from one-half hour after sunset to one-half hour before sunrise, display at least two lighted lamps on the front and one on the rear of such vehicle, which shall also display a red light visible from the rear. The rays of such rear lamp shall shine upon the number plate carried on the rear of such vehicle in such manner as to render the numerals thereon visible for at least fifty feet in the direction from which the motor vehicle is proceeding. The light of the front lamps shall be visible at least two hundred feet in the direction in which the motor vehicle is proceeding. Every person operating or driving a motor vehicle on the public highways of this state shall also, when approaching a crossroad outside the limits of a city or incorporated village, slow down the speed of the same and shall sound his bell, horn or other device for signaling in such a manner as to give notice and warning of his approach.

2. Stopping on signal, and other regulations. A person operating or driving a motor vehicle shall, on signal by raising the hand, from a person riding, leading or driving a horse or horses or other draft animals, bring such motor vehicle immediately to a stop, and, if traveling in the opposite direction, remain stationary so long as may be reasonable to allow such horse or animal to pass, and, if traveling in the same direction, use reasonable caution in thereafter passing such horse or animal; provided that, in case such horse or animal appears badly frightened or the person operating such motor vehicle is so signaled to do, such person shall cause the motor of such vehicle to cease running so long as shall be reasonably necessary to prevent accident and insure the safety of others. In approaching or passing a car of a street railway which has been stopped to allow passengers to alight or embark, the operator of every motor vehicle shall slow down and if it be necessary for the safety of the public he shall bring said vehicle to a full stop. Upon approaching a pedestrian who is upon the traveled part of any highway and not upon a sidewalk, and upon approaching an intersecting highway or a curve or a corner in a highway where the operator's view is obstructed, every person operating a motor vehicle shall slow down and give a timely signal with his bell, horn or other device for signaling.

3. Rules of the road. Whenever a person operating a motor vehicle shall meet on a public highway any other person riding or driving a horse or horses or other draft animals or any other vehicle, the person so operating such motor vehicle shall seasonably turn the same to the right of the center of such highway so as to pass without interference. Any such person so operating a motor vehicle shall, on overtaking any such horse, draft animal or other vehicle, pass on the left side thereof, and the rider or driver of such horse, draft animal or other vehicle shall, as soon as practicable, turn to the right so as to allow free passage on the left. Any such person so operating a motor vehicle shall, at the intersection of public highways, keep to the right of the intersection of the centers of such highways when turning to the right and pass to the right of such intersection when turning to the left.

Sec. 287. Speed permitted. Every person operating a motor vehicle on the public highway of this state shall drive the same in a careful and prudent manner and at a rate of speed so as not to endanger the property of another or the life or limb of any person; provided, that a rate of speed in excess of thirty miles an hour for a distance of one-fourth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent.

Sec. 288. Local ordinances prohibited. Except as herein otherwise provided, local authorities shall have no power to pass, enforce or maintain any ordi-

nance, rule or regulation requiring from any owner or chauffeur to whom this article is applicable any tax, fee, license or permit for the use of the public highways, or excluding any such owner or chauffeur from the free use of such public highways, excepting such driveway, speedway or road as has been or may be expressly set apart by law for the exclusive use of horses and light carriages or in any other way respecting motor vehicles or their speed upon or use of the public highways; and no ordinance, rule or regulation contrary to or in anywise inconsistent with the provisions of this article, now in force or hereafter enacted, shall have any effect; provided, however, that the power given to local authorities to regulate vehicles offered to the public for hire, and processions, assemblages or parades in the streets or public places, and all ordinances, rules and regulations which may have been or which may be enacted in pursuance of such powers shall remain in full force and effect; and provided, further, that local authorities may set aside for a given time a specified public highway for speed contests or races, to be conducted under proper restrictions for the safety of the public; and provided, further, that local authorities may exclude motor vehicles from any cemetery or grounds used for the burial of the dead, and may by general rule, ordinance or regulation exclude motor vehicles used solely for commercial purposes from any park or part of a park system where such general rule, ordinance or regulation is applicable equally and generally to all other vehicles used for the same purposes, and provided further that nothing in this article contained shall impair the validity or effect of any ordinances, regulating the speed of motor vehicles, or of any traffic regulations with regard to the operation of motor vehicles, heretofore or hereafter made, adopted or prescribed pursuant to law in any city of the first class; provided, further, that the local authorities of other cities and incorporated villages may limit by ordinance, rule or regulation the speed of motor vehicles on the public highways, such speed limitation not to be in any case less than one mile in four minutes, and the maintenance of a greater rate of speed for one-eighth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent, and on further condition that each city or village shall have placed conspicuously on each main public highway where the city or village line crosses the same and on every main highway where the rate of speed changes, signs of sufficient size to be easily readable by a person using the highway, bearing the words, "City of \_\_\_\_\_" or "Incorporated village of \_\_\_\_\_," "Slow down to \_\_\_\_\_ miles" (the rate being inserted), and also an arrow pointing in the direction where the speed is to be reduced or changed, and also on further condition that such ordinance, rule or regulation shall fix the punishment for violation thereof, which punishment shall, during the existence of the ordinance, rule or regulation, supersede those specified in subdivision two of section two hundred and ninety of this chapter but, except in cities of the first class, shall not exceed the same. Official copies of all local ordinances passed under the provisions of this subdivision shall be filed with the secretary of state at least thirty days before they shall respectively take effect and all such local ordinances shall be printed in pamphlet form and issued at regular intervals by the secretary of state.

Sec. 289. License of chauffeurs; renewals. 1. License of chauffeurs. Application for license to operate motor vehicles, as a chauffeur, may be made, by mail or otherwise, to the secretary of state or his duly authorized agent upon blanks prepared under his authority. The secretary of state shall appoint examiners and cause examinations to be held at convenient points throughout the state as often as may be necessary. Such applications shall be accompanied by a photograph of the applicant in such numbers and forms as the secretary of state shall prescribe, said photograph to be taken within thirty days prior to the filing of said application and to be accompanied by the fee provided herein. Before such a license is granted the applicant shall pass such examination as to his qualifications as the secretary of state shall require, and no license shall be issued until the secretary of state or his authorized agent is satisfied that the applicant is a proper person to receive it. No chauffeur's license shall be issued to any person under eighteen years of age. To each person shall be assigned some distinguishing number or mark, and the license issued shall be in such form as the secretary of state shall determine; it may contain special restrictions and limitations concerning the type of motor power, horsepower, design and other features of the motor vehicles which the licensee may operate; it shall contain the distinguishing number or mark assigned to the licensee, his name, place of residence and address, a brief description of the licensee for the purpose of identification and the photograph of the licensee. Such distinctive number or mark shall be of a distinctly different color each year and in any year shall be of the same color as that of the number plates issued for that year. The secretary of state shall furnish to every chauffeur so licensed a suitable metal badge with the distinguishing number or mark assigned to him thereon without extra charge therefore. This badge shall thereafter be worn by such chauffeur pinned upon his clothing in a conspicuous place, at all times while he is operating or driving a motor vehicle upon the public highways. Said badge shall be valid only during the term of the license of the chauffeur to whom it is issued as aforesaid. Every person licensed to operate motor vehicles as aforesaid shall indorse his usual signature on the margin of the license, in the space pro-

vided for the purpose, immediately upon receipt of said license, and such license shall not be valid until so indorsed. Every application for license filed under the provisions of this section shall be sworn to and shall be accompanied by a fee of five dollars. The license hereunder granted on or before August first, nineteen hundred and ten, shall take effect on that date, and licenses issued prior to January thirty-first nineteen hundred and eleven, shall expire on that date. The fees for such license shall be one-half of the annual fees provided herein.

2. Chauffeurs' licensed registration book. Upon the receipt of such an application, the secretary of state shall thereupon file the same in his office, and register the applicant in a book or index which shall be kept in the same manner as the book or index for the registration of motor vehicles, and when the applicant shall have passed the examination provided for in the preceding section, the number or mark assigned to such applicant together with the fact that such applicant has passed such examination shall be noted in said book or index.

3. Unauthorized possession or use of license or badge. No chauffeur having been licensed as herein provided shall voluntarily permit any other person to possess or use his license or badge, nor shall any person while operating or driving a motor vehicle use or possess any license or badge belonging to another person, or a fictitious license or badge.

4. Unlicensed chauffeurs cannot drive motor vehicle. No person shall operate or drive a motor vehicle as a chauffeur upon a public highway of this state after the first day of August, nineteen hundred and ten, unless such person shall have complied in all respects with the requirements of this section; provided, however, that a nonresident chauffeur, who has registered under provisions of law of the foreign country, state, territory or federal district of his residence substantially equivalent to the provisions of this section, shall be exempt from license under this section; and provided, further, he shall wear the badge assigned to him in the foreign country, state, territory or federal district of his residence in the manner provided in this section.

5. Renewal. Such license shall be renewed annually upon the payment of the same fee as provided in this section for the original license, such renewal to take effect on the first day of February of each year.

Sec. 290. Punishment for violation; procedure. 1. The violation of any of the provisions of sections two hundred and eighty-two, two hundred and eighty-three and two hundred and eighty-four of this article shall constitute a misdemeanor punishable by a fine not exceeding fifty dollars.

2. The violation of any of the provisions of section two hundred and eighty-seven of this article shall constitute a misdemeanor punishable by a fine not exceeding one hundred dollars.

3. Punishment for operating motor vehicle while in an intoxicated condition; for going away without stopping after accident and making himself known. Whoever operates a motor vehicle while in an intoxicated condition shall be guilty of a misdemeanor. Any person operating a motor vehicle who, knowing that injury has been caused to a person or property, due to the culpability of the said operator, or to accident, leaves the place of said injury or accident, without stopping and giving his name, residence, including street and street number, and operator's license number to the injured party, or to a police officer, or in case no police officer is in the vicinity of the place of said injury or accident, then reporting the same to the nearest police station, or judicial officer, shall be guilty of a felony punishable by a fine of not more than five hundred dollars or by imprisonment for a term not exceeding two years, or by both such fine and imprisonment; and if any person be convicted a second time of either of the foregoing offenses, he shall be guilty of a felony punishable by imprisonment for a term of not less than one year and not more than five years. A conviction of a violation of this subdivision shall be reported forthwith by the trial court or the clerk thereof to the secretary of state, who shall upon recommendation of the trial court suspend the license of the person so convicted or if he be an owner the certificate of registration of his motor vehicle and, if no appeal therefrom be taken, or if an appeal duly taken be dismissed, or the judgment affirmed, and upon notice thereof by said clerk, the secretary of state shall revoke such license or in the case of an owner the certificate of registration of his motor vehicle, and shall order the license or certificate of registration delivered to the secretary of state, and shall not reissue to him said license or certificate of registration or any other license or certificate of registration unless the secretary of state in his discretion, after an investigation or upon a hearing, decides to reissue or issue such license or certificate.

4. Any chauffeur operating a motor vehicle while his license is suspended or revoked shall be guilty of a misdemeanor.

5. Any person who operates any motor vehicle while a certificate of registration of motor vehicle issued to him is suspended or revoked shall be guilty of a misdemeanor.

6. Upon a third or subsequent conviction of a chauffeur for a violation of the provisions of section two hundred and eighty-seven, or an ordinance, rule or regulation regulating speed of motor vehicles under section two hundred and eighty-eight, the secretary of state, upon the recommendation of the trial court, shall forthwith revoke the license of the person so convicted and no new license shall be issued to such person for at least six months after the date of such conviction nor thereafter except in

the discretion of the said secretary of state.

7. The violation of any of the provisions of section two hundred and eighty-nine of this article shall constitute a misdemeanor punishable by a fine not exceeding fifty dollars.

8. Any person making a false statement in the verified application for registration shall be guilty of a misdemeanor punishable by a fine of not exceeding fifty dollars.

9. Any person violating any of the provisions of any section of this article for which violation no punishment has been specified, shall be guilty of a misdemeanor punishable by a fine of not exceeding twenty-five dollars.

10. Certifying conviction to the secretary of state. Upon the conviction of any person for a violation of any of the provisions of this article the trial court or the clerk thereof shall immediately certify the facts of the case, including the name and address of the offender, the judgment of the court and the sentence imposed, to the secretary of state, who shall enter the same either in the book or index of registered motor vehicles or in the book or index of registered chauffeurs, as the case may be, opposite the name of the person so convicted, and in the case of any other person, in a book or index of offenders to be kept for such purpose. If any such conviction shall be reversed upon appeal therefrom, the person whose conviction has been so reversed may serve on the secretary of state a certified copy of the order of reversal, whereupon the secretary of state shall enter the same in the proper book or index in connection with the record of such conviction.

11. Release from custody, bail, etc. In case any person shall be taken into custody charged with a violation of any of the provisions of this article, he shall forthwith be taken before the nearest magistrate, captain, lieutenant, clerk of the court or acting lieutenant who shall have the power of a magistrate and be entitled to an immediate hearing or admission to bail, and if such hearing cannot then be had, he shall be released from custody on giving a bond or undertaking, executed by a fidelity or surety company authorized to do business in this state, or other bail in the form provided by section five hundred and sixty-eight of the code of criminal procedure, such bond or undertaking to be in an amount not exceeding one hundred dollars, if the charge be for a misdemeanor, for his appearance to answer for such violation at such time and place as shall then be indicated. In case a person is taken into custody charged with being guilty of a felony in violation of any of the provisions of this article, such bond or undertaking shall be in an amount not less than one thousand dollars. On giving his personal undertaking to appear to answer any such violation at such time and place as shall then be indicated, secured by the deposit of a sum of money equal to the amount of such bond or undertaking, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle as herein provided with a written consent given at the time by the owner who must be present, with such officer; or in case such person is taken into custody because of a violation of any of the provisions of this article other than on a charge of violating any of the provisions of subdivision three of section two hundred and ninety and such officer is not accessible, he shall forthwith released from custody on giving his name and address to the person making the arrest and depositing with such arresting officer the sum of one hundred dollars, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or, in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent at the time by the owner who must be present; provided that, in any such case, the officer making the arrest shall give a receipt in writing for such sum or vehicle deposited and notify such person to appear before the most accessible magistrate, describing him, and specifying the place and hour. In case such bond or undertaking shall not be given or deposit made by the owner or other person taken into custody, the provisions of law in reference to bail, in cases of misdemeanor, shall apply. Where the charge is a violation of subdivision three of section two hundred and ninety of this article, the provisions of law in reference to bail in cases of a misdemeanor or a felony as the case may be shall apply exclusively.

12. Holding defendant to answer where magistrate has no jurisdiction to try offender; admitting to bail. In case the magistrate before whom any person shall be taken, charged with the violation of any provision of this article, shall not have jurisdiction to try the defendant, but shall hold the defendant to answer as provided by section two hundred and eighty of the code of criminal procedure, he shall admit such defendant to bail upon his giving a surety company's bond or undertaking to appear to answer for such violation at such time and place as shall then be indicated, or upon his giving a written undertaking in the form provided in section five hundred and sixty-eight of the code of criminal procedure in a sum not exceeding one hundred dollars, except that in a case where the defendant is charged with a violation of any of the provisions of subdivision three of section two hundred and ninety of this article, the provisions of law in reference to bail in cases of a misdemeanor or a felony as the case may be shall apply exclusively.

13. Disposition and return of bail. Such bail as may be deposited as herein provided shall be held by the officer accepting the same or the clerk of the

court. Upon the person who has been taken into custody and given security or bail for his appearance surrendering himself for trial and upon the conclusion of such trial the court shall issue to the defendant an order upon the magistrate or clerk of the court or other officer authorized to accept bail to return or deliver back said security or bail as was given.

14. A conviction of violation of any provision of this article shall not be a bar to a prosecution for an assault or for a homicide committed by any person in operating a motor vehicle.

Sec. 291. Disposition of registration fees; fines and penalties. 1. The registration fees provided herein shall be paid by the secretary of state into the state treasury.

2. Disposition of fines and penalties. On the first day of each month or within ten days thereafter all fines, penalties or forfeitures collected for violations of any of the provisions of this article or of any act in relation to the use of the public highways by motor vehicles now in force or hereafter enacted, under the sentence or judgment of any court, judge, magistrate or other judicial officer having jurisdiction in the premises, shall be paid over by such court, judge, magistrate or other judicial officer to the treasurer of the state, with a statement accompanying the same, setting forth the action or proceeding in which such moneys were collected, the name and residence of the defendant, the nature of the offense, and the fine, penalty, sentence or judgment imposed. On the first day of each month or within ten days thereafter, every judge, magistrate or clerk of a court having jurisdiction of the violation of any of the provisions of this article, shall make and forward to the treasurer of the state, a verified report of all criminal actions or proceedings instituted or tried before him or it during the preceding calendar month for violation of any of the provisions of this article, which report shall set forth the name and address of the defendants, the nature of the offenses and the fines and penalties collected or imposed by such court, judge, magistrate or judicial officer, which report shall be open to inspection during reasonable business hours to any citizen of the state. On or before the first day of February of each year, the treasurer shall transmit to each branch of the legislature a statement showing the amount of the receipts under this article during the preceding fiscal year paid into the state treasury.

3. All moneys paid into the state treasury pursuant to this article shall be appropriated and used for the maintenance and repair of the improved roads of the state, under the direction of the state commission of highways.

Sec. 292. Rates of toll on motor vehicles. Where a different rate is not otherwise prescribed or permitted by law, any person or corporation maintaining a plankroad, turnpike or bridge and authorized, or which shall be hereafter authorized, to receive tolls for the passage of vehicles over the same, may charge and receive for each and every motor vehicle propelled by any power other than animal power, passing over the same, a toll rate not greater than the maximum rate allowed by law to be charged and received for the passage of a vehicle drawn over such road or bridge by two animals, provided that for such motor vehicles designed to carry only two persons the rate of toll charged or received shall not exceed the maximum rate allowed by law to be charged and received for the passage of a vehicle drawn over such road or bridge, without a load, by a single animal.

Sec. 293. Acts repealed. All acts or parts of acts inconsistent with this article or contrary thereto are hereby expressly repealed.

Sec. 2. This act shall take effect August first, nineteen hundred and ten, excepting that applications for registration may be made, examinations held and number plates, licenses and badges issued, at any time within ninety days prior to the time of the taking effect of this article.

### Brooklyn Horse-Trot Bill Slips Through.

Although the automobilists managed to block the original sneak bill of the Brooklyn "horse-trotters" to have part of Coney Island boulevard set aside for their permanent use, they were not as successful when a second attempt was made. In some mysterious manner, the Cullen-Goodspeed bill was slipped through the committee without a public hearing of any sort, and, unbeknown to most of those who were opposed to it, passed by the legislature. An effort is to be made to defeat it, however, on the occasion of a hearing which shortly will be held before Mayor Gaynor in New York City, at which the automobile interests will be adequately represented, Alex. Schwalbach, a veteran campaigner, having taken up the matter and made arrangements for the proceedings.

## WHEN "TILLY" SPRAINED HER ANKLE

It Gave the Automobile Another Chance to Prove its Utility—And "Tilly" Was no Featherweight.

While motor ambulances for horses have been in use for some time in New York and other large cities, for obvious reasons there has never been any necessity for installing elephant ambulances. A Studebaker electric truck, therefore, has the distinction of being the only vehicle which ever has played

"TILLY" EN ROUTE TO THE VETERINARY

the part—that is, which has transported a four-ton elephant over ordinary streets. During a visit of the Robinson Bros.' circus to Ohio, a heavily loaded wagon got stuck in the mud, and "Tilly," a big elephant belonging to the show, was requisitioned to push the wagon out of the deep mud. She had the misfortune to strain a tendon in her left foot and required medical assistance. The nearest veterinary's hospital was at South Bend, Ind., the next stopping place of the circus, and a Studebaker truck was ordered to be at the station ready to convey the injured pachyderm to the veterinary's office. The accompanying photograph shows "Tilly" in the "ambulance" leaving the grounds for the veterinary's office.

### "Excursion Rates" on the Motor Parkway.

Saturday, May 28, will witness the opening of another section of the Long Island Motor Parkway. The portion which now is offered to the motoring public extends westward from the Meadow Brook Lodge to the Jericho turnpike, about one-half mile east of Krug's Corner. The new road surface is different from that used on the other portions of the parkway, being resil-

ient and lively. It has an asphaltic surface, mixed with clean screened sand and gravel. This mixture is laid on a concrete foundation four inches in thickness. Nearly all the curves on the old sections of the parkway also have been treated with this new covering. For the use of the parkway on Saturdays and Sundays a special excursion rate of \$1 has been established.

### Improved Ferry Service Inaugurated.

The automobile ferry service between Rye, N. Y., and Sea Cliff, L. I., across Long Island Sound, which proved so popular last

year, was inaugurated on May 15th for the 1910 season. The large ferryboat Hoboken, belonging to the Lackawanna railroad, will be operated over this route, and will provide room enough for fifty large cars per trip, thus assuring motorists against being left on the dock.

### When Exceeding Speed Limit is Excusable.

Although admitting that she was going faster than the law allowed, Miss Muriel Spencer, of New York City, was freed by Magistrate Barlow in the West Side court. Miss Spencer explained that she was taking a trained nurse to her mother, who suddenly had been taken ill, and that the road was clear of traffic. The court considered the excuse given satisfactory.

### The Most Populous Motor Town.

The town of Onida, S. D., claims the honor of owning a greater number of automobiles to the number of population than any other town in the country. The town has but a population of 250, women and children included, and yet there are 26 motor cars owned by its residents. The farmers in the remaining part of the county (Sully) own as many more.

## WOMAN BUYER WHO UNDOID THE BOSS

The Boss, He "Took it Out" on the Salesman—The Sad Story of the Loss of Seven Hundred Dollars.

At least one woman in New York City is \$700 to the good through buying a used car from the proprietor of the concern instead of from the salesman who originally showed it to her and got her positive order for it. The machine was of the large, expensive type, and on her first visit the woman was sufficiently impressed with it to order it set aside for her until she could come in with the money for it, the price which the salesman named having been entirely satisfactory. On her second visit she was met by the proprietor himself, who, in the absence of the salesman with whom she had dealt, undertook to close the bargain.

With true feminine intuition in bargaining, she again asked the price, without indicating that a figure had been named before. The proprietor, whose success in the second-hand field largely has been due to his quick turnovers, named a rockbottom price that gave him only a modest profit and was \$700 less than what she had agreed to give when negotiating with his salesman. She promptly paid over the cash and took possession of the machine.

When the situation subsequently became known to both the salesman and the proprietor, the latter did not accuse himself of a mistake or indicate that the salesman was better at getting a good price than himself. What he did was to give the salesman a warm "laying out" for not being "on the job" when the woman with the ready money arrived, in order that the \$700 might thereby have been saved to the firm.

### The Chauffeur and the Pedestrian.

That a chauffeur who comes near knocking down a pedestrian and is given a beating in consequence, has no claims for damages and cannot have the near-victim held for assault, is the ruling made by Magistrate O'Connor of New York. Charles H. Lund was the chauffeur who learned this lesson. He was arrested on the complaint of Benjamin Wells, a broker, on a charge of criminal carelessness. In court it developed that the chauffeur had grazed Mr. Wells and that the latter had struck him with an umbrella. The driver was fined \$3, and after paying the fine attempted to lodge a complaint against the broker for assault and battery. The magistrate refused to entertain the complaint, declaring, in substance, that a man being almost run over by an automobile has a perfect right to punch the chauffeur's head if he wants to go to the trouble.

## STUDY SPEEDOMETER ACTION

Columbia Experimenters Find that Temperature Changes May Cause Errors—  
Magnetic Type Under Fire.

Motorists who have been puzzled not a little over the apparent fact that their cars run considerably faster in winter than in summer and who have been dissatisfied with the hypothesis that it is due to the greater

tests recently completed at the laboratories of Columbia University, in which the effect of temperature variations upon speedometer indications has been very carefully observed.

The result of the experiments in question, which were conducted by Prof. George B. Pegram and Burton W. Kendall, shows that under such extreme differences in temperature as may exist between a hot summer day and a cold winter night, errors in the apparent speeds as shown by instruments

words, when the car is travelling at the actual rate of 60 miles per hour, there may be a discrepancy of as much as 10 miles in the instrument readings.

That errors of this sort are due to structural peculiarities is shown by the results obtained by submitting an instrument of the centrifugal type to a similar test, which showed it to give practically negligible errors, though appreciably affected by temperature and in amounts increasing with the speeds. In the official report of the tests, the reason for the discrepancies in the indications of the magnetic instruments is ascribed to variations in the electrical resistance of the aluminum disc, the induction of currents in which causes the displacement of the indicating needle. In explaining the method of conduct of the test on the three instruments, which are here designated as I, II, and III, the first being centrifugal in its action and the other two magnetic, the report says:

"The three speedometers were mounted on a wooden base, and then placed inside a tin box about 15x12x10 inches. This box was provided with a glass top and had a 1½-inch tube running out from one end at the bottom, through which tube the flexible shafts ran to the speedometers. The box was set inside a large cylindrical tank, with three inch-high wood blocks under the box.

"The temperature of the speedometers was varied from the temperature obtained by surrounding the box with a mixture of ice and salt, to a temperature attained by filling the tank with water up to the top of the speedometer box and heating as much as desired by a gas stove underneath the tank. The temperatures were read by two thermometers in the speedometer box, with bulbs right against the metal cases of the speedometers. The readings of the thermometers never differed from each other more than a degree, and as the rate of change of temperature was slow, not more than 10 degrees per hour during the measurements, it is evident that the temperature within the box was sensibly uniform for the purposes of these tests.

"The flexible shafts of the speedometers were geared to a shaft run by an electric motor, with suitable arrangements for varying its speed. The mean actual speed during any one set was measured by timing the revolution counter on the end of the motor shaft and computing the speed that the instruments should properly show on the basis that 2,560 revolutions per minute of the motor shaft corresponded to a 60-mile per hour speed for the speedometers. This factor 2,560 was obtained by comparing the mileage run off on the speedometers with the number of revolutions as given by the revolution counter on the shaft. . . .

"In taking readings of the instruments at a certain speed and temperature the motor was adjusted to run at about the speed desired, the temperature read, the speedometers read in succession until four read-

CURVES SHOWING EFFECT OF TEMPERATURE ON SPEED INDICATORS

density of the air at low temperatures, may solace themselves with a new and somewhat novel explanation of the phenomenon, if it happens that their speed measurements are made by means of an instrument of the magnetic type. At least, such is a conclusion which may be drawn from a series of

of the class mentioned may become important, especially if very high speeds are made. The amount of such variations from the true reading of the instrument, as shown by the tests, amounts to something over two-tenths of one per cent. for every degree of difference in temperature. In other

ings each had been recorded by one observer, while the other timed the number of revolutions of the shaft, from the hundred nearest the beginning to the hundred nearest the end of the series of readings of the speedometers; finally the temperature was read again. In the accompanying tables each of the speedometer readings is then the mean of four readings taken during the observation at that speed and temperature. The readings of any one speedometer during one set of readings did not vary more than  $1\frac{1}{2}$  miles per hour, and in most of the sets were constant so far as could be observed."

The results obtained are indicated by the accompanying diagrams, which show the errors at various rates of speed with sustained temperatures ranging from 16.3 degrees Fahr. to 137.5 degrees. The following table affords particulars as to the mean temperature conditions under which the tests were made and the exact speeds of the different runs, from which the errors were observed:

Reading	TEMPERATURE			NO. OF REV. DURING TRIP	TIME (seconds)	SPEED, in mi. per hr. (2000 rev. per min.—50 mi. per hr.)
	Ind.	Cent.	MEAN, Fahr.			
- 8.5	- 9.0	- 6.75	+16.3"	800	118.0	9.6
				1400	107.8	18.3
				2100	151.3	26.8
				4000	126.2	41.4
				2600	98.4	51.5
+ 8.0	+10.1	+ 9.0	+8.5"	1000	126.0	11.3
				1100	77.4	20.0
				1800	90.8	37.9
				2600	111.8	44.1
				3400	90.0	58.1
21.5	22.3	21.9	71.4"	800	84.3	10.9
				1200	86.8	18.4
				1500	72.0	29.3
				2000	96.0	43.0
				2800	69.3	57.9
41.5	42.4	42.0	107.6"	800	126.7	10.1
				1000	74.6	18.3
				1200	86.0	29.3
				2200	74.3	43.8
				2800	82.2	56.5
60.5	67.9	64.2	137.5"	400	97.5	8.3
				800	86.3	19.0
				1800	78.3	26.7
				2700	89.0	49.5
				4000	101.0	66.7

With regard to the performance of instrument I, the text of the report continues:

"It was hardly to be expected that within the range of temperature variation used in these experiments the changes in the dimensions of the parts and in the elasticity of the springs would have much effect on the readings of the instrument. Running 60 miles per hour this speedometer reads 2 miles per hour higher when at 137.5 degrees than when at 16.3 degrees Fahrenheit. The difference in reading is approximately proportional to the difference in temperature, and to the actual speed. We may express this by saying that the difference in reading per degree difference of temperature is .00028 of the speed. For a temperature difference of 60 degrees Fahr. the temperature error would hardly be detectable at moderate speeds, and small even at 60 miles per hour."

The first of the magnetic instruments, which is designated on the diagram as

Speedometer II, is discussed as follows:

"In this instrument the poles of a magnet rotating under an aluminum disc generate currents in the disc. The reaction of these currents on the magnetic field supply a torque to the disc, which is nicely pivoted and restrained by a hair-spring. The torque is proportional to the strength of the induced currents in the disc and these to the rate of rotation of the magnet. The disc is therefore pulled around against the reaction of the hair-spring through an angle proportional to the speed of the rotating magnet, which angle is indicated by a pointer on the mile per hour scale.

"This speedometer shows a marked and fairly regular variation in its readings with variations in temperature. At low temperature, 16 degrees Fahr., it reads too high throughout the scale by about  $16\frac{2}{3}$  per cent. At high temperature, 137.5 degrees Fahr., it reads too low by about 15 per cent. It would read correctly throughout the scale when at a temperature of about 83 degrees Fahr.

"The variation in the reading per degree changes of temperature is 0.27 per cent. When used in a car the variation in the temperature of the speedometer between summer and winter is likely to be as much as 62 degrees Fahr., which would mean a discrepancy of 10 miles per hour between summer and winter readings when actually going 30 miles per hour. According to this speedometer a car would show much better speed in winter than in summer.

"Since the reading of this instrument is proportional to the induced currents in the disc, and these are inversely proportional to the resistance of the disc, the variation of the resistance with temperature must affect the speedometer readings. The temperature coefficient of the electrical resistance of aluminum is .0021 per degree Fahr. This will account for only part of the variation per degree—namely, .0027—in the speedometer readings. The rest is doubtless to be accounted for by the decrease in the strength of the magnet as the temperature increases. With properly made magnets this change is very small, but as the torque on the disc depends on the square of the magnetic field intensity, the variation in the strength of the magnet means double the variation in the speedometer reading."

The second magnetic instrument yielded better results. Says the report:

"The construction and behavior of this instrument are essentially the same, though the effect of the temperature is not so large as in the case of the —, (the first magnetic instrument tested). The variation in the reading per degree change of temperature is .0022. This can be almost wholly accounted for by the temperature coefficient of the electrical resistance of the aluminum disc."

While at first sight the effect of such errors as are here shown to exist might be taken to indicate the general unfitness

of instruments of the magnetic type for use, further consideration tends to show that for all ordinary purposes the effect in question may be held to be of no material consequence. In the first place, it is only at speeds considerably above the average that the erroneous readings become sufficiently inexact to cause serious inconvenience to the user. Save as impairing the contrast of speed performances made at different seasons of the year, a reading of one or two miles an hour above or below the true speed is not likely to be considered a serious discrepancy.

A still more significant point, however, is that variations in tire inflation pressures, the use of tires having different classes of tread surface, or even the wear on tread surfaces has a certain influence on speedometer readings which renders absolute accuracy impossible. Experiments conducted on the Brooklands track, in England, late last year showed that with extreme variations in inflation pressures a total discrepancy amounting to as much as 5 per cent. of the nominal diameter might be introduced, ranging from 1 per cent. large down to 4 per cent. small, with the tire partially deflated. Obviously, the possibility of such errors as may be introduced in this way, constitutes a tolerance, within which the inaccuracies which the investigators charge to the magnetic instruments would seem to lie except in cases where very high speeds and extreme differences in temperature are involved.

For instance, if a car equipped with such a speed indicating instrument were to be driven at an indicated rate of a mile a minute over the snow in Alaska, and later at an indicated rate of a mile a minute in the Canal Zone, it is evident that the actual speeds would be below and above the apparent rate in both instances. By the results of the tests, however, it is made to appear that under more ordinary conditions the discrepancies introduced would not be of a very great moment in the face of other and ineradicable errors.

#### Vegetable Fibers for Tire Treads.

A tire structure in which the rubber is filled with minute threads of a vegetable fiber which permeate it in all directions, is the invention of a member of a London tire company, according to Consul-General John L. Griffiths. The theory is that by combining pure rubber with the vegetable fibers certain defects will be avoided which are produced by incorporating with the rubber such mineral substances as magnesia, chalk, oxide of zinc and sulphur, such as frequently are used in compounding. By enabling the fibers and rubber to form a mutual support, much in the same way that the silk threads strengthen the substance of American paper money, it is said that a compound is produced which is remarkably tough and retractile, and equally useful in other respects.

## CARHARTT'S CHARACTERISTICS

One of Detroit's Newest Cars Discloses Attractive Designing and Standard Construction—Carburettor a Feature.

One of the most remarkable features of the automobile industry in its present stage is the way in which the influx of newcomers continues. Rapidly succeeding the announcements of new organizations which are about to enter the field, announcements of their products appear. One of the most recent of these, heralded as "first in the field for 1911," is the Carhartt, which is the brand new product of the newly formed

gle cam shaft. The cam shaft and engine auxiliary gears are housed in an integrally cast extension to the crank case, and are thoroughly lubricated in common with the remainder of the engine.

The water circulation is maintained by means of a centrifugal pump; a commendable feature of the system being a strainer which is combined with the pump mechanism and which is so constructed that it can be removed for cleaning without necessitating the breaking of any of the water connections. Induced draught through the radiator is maintained by means of a belt driven fan. Ignition is by the Bosch dual method, with dashboard mounted lock switch and coil combination. In connection with the construction of the carburettor,

## CARING FOR THE STEERING GEAR

Why that Important Essential Requires Attention—Strains Involved and the Parts that Wear First.

Defective steering gears probably are responsible for more accidents than are generally attributed to it, and it is part of the careful motorist's duty to give much of his attention and care to this part of his car's anatomy. Speaking of the subject of care and maintenance of steering gear, a Briton analyzes the construction of the steering pillar, the worm and the quadrant, and comes to the conclusion that although the principle may work fairly well on small cars, it cannot be said to comprise a perfect mechanical design, as the wheels run on arms of "L" pattern which, owing to the strains set up, should be closely looked after from time to time.

With regard to the steering bar forming a connecting link between the two front wheels, the most general practice in modern car design is to place the tie rod behind the axle, as being less liable to get damaged in that position.

"Some motorists place little importance on this precaution," says the man who holds this view. "At the same time, makers must be pardoned for taking every possible care in this direction when it is remembered that the slightest deflection from the original alignment affects the traveling wheels and throws them out of being perfectly parallel to each other. When such is the case, the steering is very materially affected, and, for the same reason, after the sensation of an abnormal contact with any possible object that could have only barely touched the steering gear, an examination should be made.

"Any sudden shock to the wheels has a tendency to force them backwards; this movement is in turn conveyed to the rod in question, and felt by the steering wheel. Fortunately, such strains are not compressional ones; if they were, the rod would not withstand such sudden calls from its normal state. The writer, in a previous article upon another subject, mentioned that metals would stand tensional rather than compressional stresses. To the uninitiated the following example will make this contention quite clear: An ordinary walking-stick secured to a hook will support the weight of two or three men hanging on to it. If the same stick be taken down, it will double up under the pressure of one hand. The former pressure is tensional, the latter compressional.

"The first parts of a steering gear to wear are the swivel joints and pins; when such has taken place considerable play exists, and has a similar effect to that of backlash of the steering wheel. Many drivers

NEW 35 HORSEPOWER CARHARTT CAR FROM DETROIT

Carhartt Automobile Corporation, of Detroit.

As the picture shows, the Carhartt is an essentially modern and neatly drawn machine of medium power, built as close to the road as long, flat suspension and double dropped frame will allow it to go. The standard pattern is that illustrated, which mounts a five passenger body regularly equipped with gas headlights, combination oil and electric side and tail lamps, gas tank and tire irons. It has 34 by 4 inch quick detachable tires, front and rear, 118 inch wheel base and 56-inch tread. In addition to the standard touring pattern, the car is made up in closed coupe, limousine, landaulet and torpedo body styles and also in runabout form. In the latter shape, the driver's seat is set further back on the frame than on the touring car, the entire seat is lower and is divided, the steering column is tilted to a smaller angle, and the gasoline tank is mounted behind the seat, the carburettor being fed by gravity flow.

The motor is of standard four cylinder construction, water cooled and rated at 35 horsepower with a normal speed of 1,000 revolutions per minute. Its cylinder dimensions are  $4\frac{1}{4}$  by  $4\frac{1}{2}$  inches, bore and stroke. The cylinders are cast in pairs, with water jackets integral. The valves, which are interchangeable, are mounted on the same side of the motor and operated from a sin-

distinction is claimed for the interchangeable features of the auxiliary air valve, which is so constructed that air can be drawn from either top or bottom; for the roller cam device for regulating the fuel flow and for the method of waterjacketing the mixing chamber to promote rapid vaporizing of the fuel.

Transmission is carried out by means of an enclosed multiple disc clutch, selective type three-speed change gearset and straight line propeller shaft to the full floating rear axle. The gear box is internally ribbed for strength, and is so constructed as to enclose all moving mechanism, including that which is used in making the changes. The third forward speed affords the direct drive arrangement, which is practically universal in all makes of car at the present time. The propeller shaft is equipped with two universal joints, while adequate means are provided for taking care of the torsional and driving stresses.

The spring system comprises 38-inch semi-elliptical front and 48-inch three-quarter elliptical rear members. External-internal brakes are provided on the rear wheels. The steering gear is of the worm and segment type, the steering rod is carried above the axle and, like the spring shackles, all the articulations of the guiding mechanism are provided with compression grease cups.

The Carhartt lists at \$2,250.

profess to have a partiality for the latter; this is, however, wrong in practice, and may be compared to driving a horse with a loose rein down a hill; the slack has to be hauled in before the horse's mouth is felt. If the link ends are worn they should be closed in, and if necessary the holes opened out and new pins inserted. With a worn worm little can be done, a new one is the only satisfactory solution. Road wheels that are not parallel are the best friend of tire makers, and many a tire bill has been increased from this cause. In addition, bad steering control means sudden jerks to the car and extra strain thrown on all parts."

#### Mounting of the Dash Lamps.

In mounting dash lamps not all manufacturers are as careful as they should be to see that the lights are so placed as to throw their full rays on the road. Where very high front wings are employed, together with a low, scuttle type of dash, such as many runabouts and roadster models now carry, it sometimes happens that practically the only result of lighting the dash lamps is to secure a glaring and highly colored illumination of the fenders. Obviously, this is an extremely bad arrangement, as it not only deprives the car of the signal effect of the lamps, but also tends to blind the driver.

#### Concerning Repairs to Rear Axles.

In making repairs or adjustments to a rear axle of the shaft driven type extreme care should be taken to preserve the alignment of all the parts. Even such an apparently inconsequential thing as the bending of a radius rod or the stretching or shortening of a distance rod, a break in which has been repaired by welding, may have the effect of throwing the axle sufficiently out of line to cause the spring action to be cramped, if not to throw serious strains on the universal joints of the driving gear.

#### Windage Dangerous to Wind Shields.

When applying a new wind shield to a car great care should be taken to ensure its proper installation. The great amount of pressure which the shield is called upon to bear in consequence of the "windage" of the car is not generally appreciated. At high speeds it amounts to many pounds, and unless its attachment has been made carefully, there is some danger that it may "go adrift" with more or less disastrous consequences to the driver.

#### Lubrication for Shock Absorber Joints.

It should be seen to that the non-frictional joints of shock absorbers are in good condition, free from rust and not binding in consequence of disalignment of the parts. Otherwise there is some chance that they may become "set" in the course of time, thus causing one of the arms to break and putting the device out of action.

## NEW MAGNETO MAKES TWIN SPARKS

**U. & H. Twin Armature Construction Introduced for Racing Service—How Absolute Synchronism is Ensured.**

For the purpose of ensuring absolute synchronism in the timing of engines fired by multi-point ignition, a new and altogether radical type of magneto just has been brought out by the German firm of Unterberg & Helmle, which is represented in this country by J. S. Bretz Co., New York City. As the chief application of this method of ignition thus far has been in the service of racing cars, the magneto in question is designed specifically for racing purposes, and therefore is somewhat

U. & H. MULTI-POINT IGNITION MAGNETO

radical in its application as well as novel in construction. Briefly it consists of a pair of standard armatures revolving within a common armature tunnel inside a single, large compound magnet. The action of the two sets of windings generates two entirely independent electro-motive forces, thus rendering the twin ignition systems entirely independent of one another insofar as the isolation of their circuits is concerned. At the same time, the method of construction permits the interruptions of the primary circuits to be made with absolute synchronism.

As is well known, the theory of the multi-point ignition system is that by igniting the charges within the engine cylinders at two or more points at the same instant the rate of inflammation of the charge is considerably accelerated; this effect results in a more rapid rise in pressure, increasing the main effective force of the working stroke, and also, by ensuring the completion of combustion before the release of the exhaust gases, effects better economy than otherwise would be accomplished. Although a number of other methods of applying the multi-point ignition principle have been proposed, the only one to receive at all general use is that in which two sets of spark plugs of ordinary construction are used.

In applying this system to foreign racing machines, two magnetos were employed

at first, arrangements being made to cause them to break circuit simultaneously. With this arrangement, however, some difficulty was experienced in securing the absolute synchronism in the two sparks which was desired; defects in the driving mechanism and wear in the interruptor cams tending in this direction. Of course, loss of synchronism entirely does away with the advantage gained from the dual sparking arrangement. If the second spark lags behind the first, even by a very small fraction of a second, its flame becomes practically superfluous, save in the case of a weak leading spark or a very slow burning mixture. The new U & H magneto is intended to obviate the difficulty thus explained.

As shown by the accompanying illustration, it is not unlike the standard magneto in outward form. The two armature windings, which, as before stated, are entirely independent both as to primary and secondary turns, are connected through the outer ends of the primaries to a common interruptor. The result of this is that the current interruptions are made coincidentally, thus ensuring absolute synchronism in the sparks. The two secondary currents are handled by means of a compound distributor, which preserves their isolation. Two safety spark gaps are employed to safeguard the windings in the event of a break in the secondary leads. The use of the non-adjustable interrupter, which is a characteristic feature of all U&H magneto products, tends to promote reliability because of its lack of small and delicate moving parts.

#### Automobiles to Carry Mails in Mexico.

Details of a contract between the Mexican government and the new automobile line between Iguala and Chilpancingo for the carrying of mail by that route are in course of completion, and at the general post office it is considered as final that an automobile mail service will be in operation over that line within a few weeks.

Six large passenger automobiles have already been placed in commission by the new company, according to the terms of the concession taken out by Pedro Armendaris, of Mexico City. Besides the passenger transportation, there will be an express and light freight service, with possibly later on a heavy freight service by means of big automobile trucks.

The transportation section of the Mexican post office is also considering a proposition from an American company for the carrying of mails from Jalisco, in the state of Chiapas on the Pan-American railway, to Tuxtla Gutierrez, in the same state, by automobiles, the same being a direct outcome of the report of Consul Brickwood, which was sent to the state department recently and published in the last issue of the Motor World. The service is to be similar to the one inaugurated between Iguala and Chilpancingo.

## MAGNET GOVERNOR FOR GENERATOR

New Electric Current System for Cars Has Ingenious Automatic Features—Two Sets of Accumulators Used.

Increased use of the electric light for automobile illumination has caused a revival of interest in systems which provide for the generation of current on the car and also interpose the very necessary automatic control which is required by the variations in speed to which the engine is subjected. A recent addition to the several new systems which the movement has brought forth is the invention of H. Ward

To prevent serious consequences resulting from excessive current generation at high engine speeds, an automatic governor is introduced into the system, which takes the form of a magnetic clutch on the armature shaft. When the dynamo speed reaches its safe maximum, the clutch opens, thus releasing the armature from the belt pulley, which is driven from the fan belt, or from some other convenient source. When the armature speed dies down to its normal again, the clutch picks up the pulley and the drive continues. In this way provision is made for the continuous charging of the batteries whenever the car speeds exceed ten miles per hour, the system being calculated to keep both sets of cells fully charged at all times.

## REVIVING THE REVOLVING MOTOR

Success of the Type in Aviation Renews Interest in Its Motor Car Application—Needs Modifications.

It would appear that at last a permanent application had been found for the rotary-reciprocating type of gas engine, which long has struggled for recognition in the automobile field. By a somewhat surprising deviation from current and successful practice in internal combustion engine construction, aeroplane builders have embraced that type. Despite the handicap of employing a newly developed form of engine, start-

WARD LEONARD DYNAMO MOUNTING

BATTERY BOX AND SWITCH ARRANGEMENT

BATTERY AND AUTOMATIC CONTROL

Leonard, of the Ward Leonard Electric Co., of Bronxville, N. Y. Combining a generator and a pair of accumulators, in addition to the automatic controlling devices, it provides for the entire operation of the electrical system of the car, including such use of current for jump spark ignition as may be required.

The means of regulating the armature speed of the generator, and the automatic cutout arrangement, naturally are the original and most essential elements of the system. In operation, the lighting of the machine, as well as the ignition, is by the batteries alone up to car speeds of 10 miles an hour. From this it follows also that the batteries automatically furnish any current which may be consumed if the lights are switched on while the car is standing still. As soon as car speeds upwards of ten miles an hour are reached the automatic switch closes, throwing the generator into service. At such times the current generated takes care of both charging and lighting, the dynamo being floated on the line, while the second battery remains idle.

In arranging the wiring, it is thought undesirable to "ground" one side of the lighting system, since an accidental ground from the insulated side might disable both lighting and ignition systems. For this reason the two are kept entirely separate and, as explained, the charging action is applied only to the lighting circuit. By means of throw-over switches, furthermore, it is possible to cut either battery into the ignition system, so that the arrangement really is in the nature of a safeguard.

As the illustrations show, the generator is mounted under the bonnet in the engine space and driven by any convenient means. The batteries are carried in a metallic case on the running board, in which the automatic cut-outs also are enclosed. Two throw-over switches, placed within convenient reach of the driver, as shown in one of the pictures, permit him to apply either battery to ignition or lighting service, and so to ensure the maintenance of both in a condition of continuous full charge. The system at present is being demonstrated at Broadway and 68th street, New York City.

ling results have been achieved, and there can be no doubt that the engines employed are destined to share in the prestige which the rapidly succeeding record exploits of the heavier-than-air machines are winning. Whence the question arises, Is it possible that, following its adaptation to flying machines, the rotary reciprocating engine again will be exploited as suitable for automobile use?

Already the subject has been broached abroad, with the result that at least one exponent of the automobile trade has expressed itself as favorably inclined toward it. And as time goes on and the light motor, expressly built for flying machine work, continues to improve, it is probable that the impression will grow that it has been a mistake not to do more with it in the automobile line. Therefore, it is worth while considering its peculiarities with a view to determining its real fitness for the work and especially with regard to what the future may disclose insofar as at present is possible to determine.

Speaking of the rotary-reciprocating form

of engine, it should be borne in mind that its development as a special type for aeroplane use by no means is the first application to which it has been lent with apparent success. Throughout the entire history of the automobile industry, the rotary engine has been an ever present potentiality. Many different forms have been produced in which the cylinders, in one way or another, rotated about a stationary crank shaft. In some, the cylinders were arranged parallel to the shaft, while in others they were radially mounted, as in the type which latterly has come into prominence in aeronautic performances. In one notable instance, the principle was developed very thoroughly and for a number of years has been produced in stock form and mounted in a car. This particular engine, it may be added, introduces a number of peculiar advantages which are not obtainable in the same way in any other form of construction, while in operation, efficiency and flexibility it has set an enviable standard for its class.

In its more common form the rotary engine differs from the standard automobile type mainly in that its crank shaft is stationary, while the cylinders revolve around it; this, and that the cylinders, instead of being arranged parallel to each other, are mounted radially around the shaft. In addition to reducing the overall length of the entire motor to that which would be necessary if but a single cylinder were used, this arrangement has the advantage of doing away with the flywheel; the cylinders themselves furnishing the necessary inertia effect which is obtained ordinarily by means of the balance wheel.

Counterbalancing these most obvious advantages, it is noteworthy that the rotary engine must induct its live gas and expel the waste through some form of sliding port and valve construction, or by means of valves of ordinary construction which are served through a rotary distributor valve common to all the cylinders. This, and the necessity of arranging adequate means of distributing electric current for ignition purposes, are difficulties which by no means are to be minimized. It should be added that the rotary form of motor lends itself particularly well to the purposes of air cooling, and that, as produced especially for aeroplane work, it has been reduced in weight to an extraordinary degree.

As indicating to what extent this form of engine already has been developed for the special work of the flying machine, it may be noted that the Gnome engine, which has become prominent through the flights of some of its users, weighs but 170 pounds, though said to develop no less than 50 horsepower on the brake. The cylinder dimensions are 4.3 by 4.7, it has seven cylinders, and makes its rated output at a normal speed of 1,000 revolutions per minute.

As indicating the true significance of

the weight ratio of 3.4 pounds per horsepower, a comparison with current types of American automobile engine may be interesting though not particularly important, since in aeroplane work the whole effort is to reduce weight with the design little affected by considerations of bulk; while in automobile construction, weight is rather an immaterial consideration as compared with the importance of economizing space. In the flying machine motor, also, muffling is not a vital consideration, and, indeed, in the Gnome engine the waste gases are exhausted directly to the atmosphere.

With present types of automobile motor of standard water cooled form, weights per horsepower actually developed on the bench range from 10 to 14 pounds in a majority of cases. Weights as low as 7 to 9 pounds per horsepower are exceptionally low, though a number of well known constructors are building motors as light as this; while several makers produce engines of unquestioned merit which weigh somewhere around 15 pounds to the horsepower.

The particular advantage which would follow the general introduction of the rotary form of engine to automobile use naturally would be in the way of space economy. The rotary motor is not unlike an enlarged flywheel; indeed, one new type which was exhibited during the recent show season, when assembled in its casing, much resembled the flywheel of a large engine of standard form housed in such a structure as often is produced in unit power plant construction. If air-cooled, its adoption would mean the elimination of the radiator and hence a further reduction in the necessary volume of engine space on the car. The result would be either a considerable lengthening of the body or else a corresponding reduction in the wheel base.

Here enters a very material consideration. The aeroplane engine in its present form is not developed with an eye to flexibility. In fact, the majority of its work is done with a perfectly uniform load under normal resistance. Nor has the rotary motor, save in the single instance noted, ever been brought even to a moderate plane of flexibility. To do so would require probably as much work as has been done in the same direction with the standard vertical engine. Possibly it would require as much time as has elapsed since speed governors were dispensed with in common practice and a genuine effort made to render the engine uniformly effective throughout as wide a range of speeds as possible.

In other words, while the successful application of the rotary engine to flight raises a very natural suggestion as to its applicability for automobile work, and a question as to whether it may not be transferred from the newer class of work to the older, it is evident that such a transfer could not be accomplished merely by the mechanical

method of adapting the chassis to receive the unusual form of engine.

Just as the growth of the automobile industry itself has been measured in large degree by the development of a motor especially suited to its needs, so the development of the heavier-than-air flying machine is destined to follow a similar course. Just as the forms of internal combustion engine which are suited to stationary and marine purposes are unsuitable for automobile work, and as automobile engines are unsuited for aeronautic work, so the aeroplane engine is unsuited for automobile use. The point is that each of the classes of duty mentioned requires specific attributes in its prime movers, which are different in certain important respects from those which the other classes demand.

The true merit of the rotary-reciprocating engine as regards automobile service is entirely another matter. That it is possible to construct a special form of engine for this use which will fulfil all the running requirements of automobile work, has been demonstrated successfully by more than one engineer. So radically different is the type from that of the standard form of engine, however, that serious difficulties stand in the way when it comes to a question of marketing such a product.

Were attention to be concentrated on the development of such an engine and a market for it studiously cultivated in a broad and far-reaching way, it is not at all unlikely that a better engine might be produced than at present is in use on the average machine. There is no question that the present standard of engine construction calls for an amount of engine space, and a weight to power ratio, which are higher than circumstances really call for. It is equally true that many cars are overpowered as far as the requirements of the average operator are concerned. But it is equally true that the market for such cars is so strong that the makers frequently are at a loss to keep up with it, and that the engineers engaged in their production are so far absorbed in keeping pace with the routine of development as to have no leisure for excursions far afield in the realm of the unconventional.

It is by no means impossible that the rotary engine at some future time may come into greater prominence in the automobile field than it as yet has attained. It is regarded by many engineers as a stepping stone to the gas turbine, which is the recognized goal toward which many eyes are turned, and its features in many respects are strikingly alluring. Yet it would seem that those who jump to the conclusion that its present popularity in another field augurs its early adoption in this one are doing so inadvisedly. In order even to compete with the present automobile motor, any other type must excel it; in every respect its advantages must be conspicuous.

Rambler Fifty-Four, Close-Coupled, 45 H. P., 117-inch  
Wheel Base, \$2,475 as shown

**T**HE New Rambler Fifty-Four Close-Coupled model is a light and handy car of snappy appearance, suitable for touring or roadster purposes. Also furnished with three inches additional room between the dash and front seat and with 123-inch wheel base. Prompt delivery.

## WHAT TO DO IN CASE OF ACCIDENT

### More About Fractures and the Art of Bandaging Described—Concluding Exposition of First Aid Treatment.

Fractures of the lower jaw, spinal column, ribs, collar-bone and shoulder-blade, as described in last week's *Motor World*, are by no means the only breaks that are likely to come within the ken of the automobilist, and, while the knowledge necessary to recognize and treat any sort of fracture may entail some little study and memorizing, it is valuable learning. Particularly is this true of the art of bandaging, in which few persons are properly versed but knowledge of which usually is essential in first aid treatment of the right sort.

Fracture of the humerus (upper arm-bone) may be the result of direct or indirect violence, or of muscular contraction. The signs and symptoms are usually well marked, and there is considerable shortening. If the seat of the fracture is at the surgical neck, a bony prominence may be found in the axillary space, or armpit. When reduction is to be made, the forearm and elbow should be pulled downward (extension), the shoulder acting as the counter-extension. If the fracture is about in the middle of the bone, an internal and an external splint should be applied. Great care should be exercised when placing the internal splint so as not to cause a pressure upon the important nerves and blood-vessels, by shoving the splints too far up into armpit. If the fracture is in the upper part of the bone, through the surgical neck, a soft pad may be placed in the armpit and held there by a figure-of-8 bandage, or spica, around the shoulder. The hand and wrist only should be suspended in a sling, thus allowing the elbow to drop, thereby diminishing the tendency to shorten the arm.

Fracture of the forearm generally occurs at the lower end of the radius, about two inches or less from the joint, and is known as the Colles's, or "silver fork," fracture. It receives the latter name from the peculiar appearance about the wrist, which has a fancied resemblance of a silver fork. Colles's fracture is almost as frequent as fracture of the clavicle, and is generally impacted. The arm should be placed at right angles, the thumb pointing toward the chin. An internal splint, extending from the upper part of the forearm to the wrist, and an external splint extending to the tips of the fingers, should be applied. Care should be taken that the internal splint does not press upon the vessel at the bend of the elbow. Reduction may be accomplished as follows: Should the fracture be on the right side, for instance, the attendant should grasp the right hand of the patient with the corre-

sponding one of his own, and extension be carefully made, counter-extension being performed with the left hand, which grasps the forearm above the seat of fracture.

Fracture of the middle of the forearm may be the result of direct violence. One or both of the bones may be broken. When either the radius or the ulner is broken the companion bone acts as a splint, and the deformity and other signs are not so marked. In a fracture of the shaft of the radius, which is uncommon, the usual symptoms of fracture are not noted, and, in addition, the loss to a greater or less degree of pronation and supination, or turning the hand inward and outward. Fracture of the ulner sometimes follows an attempt to ward off a blow, and is not uncommon among pugilists. Fracture at the middle of the forearm should be treated in the same manner as Colles's fracture—internal and external splints applied while the arm is bent at right angles, with the thumb turned toward the chin. The injured limb then should be supported by a sling.

Fracture of the metacarpal bones commonly is caused by direct violence, as a fall upon the hand, or striking a blow with the fist. A common swelling on the dorsum or back of the hand usually follows, and the knuckle corresponding to the broken metacarpal bone is sunken and appears to be effaced. A roller bandage, wad of cotton, oakum, or any small object of a similar nature, as a lemon, tennis ball, potato, etc., should be placed in the palm, the hand closed and retained in this position by a bandage.

Fractures of the phalanges are generally detected without much difficulty, the common signs of fracture being well marked. After reduction has been accomplished splints should be applied to the palmar and dorsal sides of the broken finger. A piece of cigar box may be used for this purpose, although a piece of tin or sheet zinc, entirely covered with adhesive plaster, would be preferable; or, after the fracture is reduced, the finger may be bound to a companion finger or covered with a narrow roller bandage, and stiffened (after being applied) with flour and white of egg, which makes a very good temporary dressing.

Fracture of the femur is one of the common fractures of the body. The great size of the bone—it being the longest bone in the body—and the fact that more or less limping, due to the shortening of the affected limb, may follow this injury (particularly in the adult), makes the treatment a matter of great importance to the surgeon. The femur may be broken at the neck, extremities or middle, the most frequent situation being about the middle of the bone. The fracture is more commonly caused by indirect violence, as falling, etc., and is oblique (in adults), which principally accounts for the shortening that follows. The signs and symptoms usually are well marked. The foot and leg are turned out-

ward, particularly if the shaft of the bone is broken. Fracture of the neck of the femur occurs in old persons and is in a great measure due to the composition of bone at this period of life, which is more dense than at any other time, and also the change of angle of the neck of the bone, and may, in the aged, follow a most trivial cause, as tripping, etc. A long external splint, extending from the axillary space, or armpit, to a short distance below the foot, is sufficient for a temporary dressing. A fence board, which is usually about six inches wide, makes an excellent splint. Before applying the splint, the thigh should be surrounded by a coat properly folded, or a shawl, etc. A bandage should then be carried around the waist, two around the thigh—one above the fracture and one below—and one around the leg and foot each, the bandage being tied on the outside of the splint. If no better support can be devised, the affected limb may be bandaged to the one on the opposite side.

Fracture of the leg usually affects both bones, although the tibia or fibula may alone be fractured, the fibula probably more often than the tibia. The fibula is generally broken nearer its lower extremity, and is known as Pott's fracture. More or less injury to the ankle-joints accompanies the latter. In fracture of both bones, which commonly occurs about the middle, the signs are generally well marked—more so than when either the tibia or fibula only is broken. Pott's fracture is attended with aversion, or turning outward, of the foot, producing a characteristic deformity. Fracture of the tibia, as the result of its superficial situation, is very often compound, the wound communicating with the fracture being frequently caused by efforts of the patient to walk immediately after the injury. The limb should be handled very carefully, and an internal and external splint applied. A pillow placed under the leg, folded over the sides, and properly retained is particularly adapted as a temporary support for this fracture. If the lower end of the fibula is broken, and the foot is turned outward, a splint, well padded, should be placed along the inner side of the leg, extending from above the knee to beyond the foot, and the leg and foot bound to it, thereby overlooking the tendency to aversion.

Fracture of the patella (knee cap) may be the result of direct violence or muscular contraction. The more common signs of the injury are inability to straighten the leg; the patient is able to walk backward, however. An examination shows a transverse separation of the knee cap, with an interval varying in width between the pieces. The knee is swollen, tense, and there is great pain. At the moment of the injury the patient often hears a sudden snap. As a temporary measure, a long posterior splint may be applied, carefully bound above and below the knee. The skill of the surgeon is

directed toward keeping the pieces in close contact until union takes place. The treatment of fracture of the metatarsal bones and the phalanges of the toes consists in binding the affected toe to the one alongside of it, or by supporting the fragments with compresses or light splints. When the foot is seriously injured by crushing, amputation is often inevitable.

#### Bandages.

Bandages are used to retain dressings in position, arrest hemorrhage and support and render immovable different portions of the body. For general use they are divided into two classes, roller and Esmarch, or triangular. The materials used for bandages include linen, flannel, calico and muslin. For ordinary purposes, unbleached muslin of a medium texture is the best fabric that can be employed. Bandages should not contain starch nor should they be pieced, as either condition produces considerable irritation of the skin, and also prevents their proper application. Roller bandages usually are made from three to four yards long, and from one to six inches wide, depending upon the part of the body to which they are to be applied—one inch for the fingers, three inches for the upper extremity, and four inches for the lower extremity, and five or six inches for the chest or abdomen. Bandages should always be torn from the piece, unless the material from which they are constructed is very thin. The selva along the edge of the fabric should always be removed before the bandages are rolled.

The application of a bandage should always be begun by laying the outer surface against the skin. When used to retain a dressing, it may be commenced at any part of an extremity, the soft dressing underneath preventing any undue interference with the circulation. When the bandage is applied for support or pressure, however, it must be started at the extreme end of the limb and bandaged toward the body, otherwise the constriction, particularly if the bandage is drawn tightly, may be followed by strangulation, and gangrene of the tissues below the bandage may result. A bandage should be closely applied to a limb, but not be made tight, and the degree of pressure should be uniform. Should any evidence of strangulation manifest itself by swelling and discoloration, and also a reduction in temperature of the limb below the bandage, the dressing must be at once removed. It is partly for this reason that the toes and fingers are left uncovered in bandaging an extremity—that they may serve as an index to the general circulation of the arm or the leg. A bandage applied dry and wetted afterward is followed by considerable shrinking, and sometimes strangulation of the tissues. A bandage should not be applied to a limb until the latter is in the position in which it is to remain.

The four-tailed bandage is made of a strip of muslin about one yard and a half long

and four inches wide, folded and torn from the ends to within two inches of the center of the bandage. One of the tails is usually made wider than the other. One of the purposes of this bandage is to support the lower jaw after a fracture or dislocation. It is to be applied by placing the center of the bandage against the chin, with the wide tails below, when the latter are turned upward and tied on the top of the head; the upper or narrow tails are carried backward and tie at the nape of the neck. Two handkerchiefs, each folded in the form of a cravat, may be used for this purpose. A four-tailed bandage, for the protection and retaining of dressings about the head, can be made of a piece of muslin, about one yard and a half long and one foot or more in width, folded and then torn from the ends to within six inches of the center. The bandage is placed on the head, the posterior tails being carried forward and tied under the chin, while the anterior are carried backward and tied or pinned at the nape of the neck.

The figure eight bandage is used about joints or where an abrupt enlargement occurs. The hip and shoulder spica are varieties of this bandage. The manner in which the layers cross each other give it the appearance of a figure of 8; hence the name. The operator places himself in front of the limb to be bandaged, which is somewhat elevated, the patient being seated or lying down. The operator, holding the bandage in his right hand, unrolls about six inches of it, the outer side of which is laid obliquely across the dorsum or top of the foot from within outward, and continued around the lower part of the ankle to the inner side, and then again over the dorsum of the foot, crossing the first portion applied, and carried downward to the base of the toes on the outer side. From this point two or three turns are made around the foot, extending upward, and thence again to the ankle, where the circular form is employed.

An inexpensive emergency case of first aid dressings for the automobilist can be procured at any pharmacy, and can be carried with little or no inconvenience. The kit should contain rolls of 1-inch, 2-inches and 3-inches cotton gauze bandage, a roll of 1-inch adhesive plaster, small amount of absorbent cotton, small bottle of aromatic spirits of ammonia, and a small quantity of powdered boric acid. The entire cost is only about 50 cents.

#### Russia Keeps Track of Private Automobiles.

Russia has started to inaugurate a new policy in connection with the automobiles owned or operated by Russian subjects within the empire. Hereafter every motor car must be registered at the nearest office of the military authorities, and in case of a declaration of war, be turned over to them immediately. It is the intention of the government to use these cars in special

motor car brigades. This new policy of Russia practically is the same as that pursued by the other European nations in connection with their steamers and railroads, both of which are at the disposal of the government the moment war is declared.

#### Taxicabs Now Are Legally Vehicles.

Governor Draper of Massachusetts has signed the law which will make it possible for motor cab operators to take legal measures in collecting fares for the use of their vehicles. The measure, which was passed without serious opposition, relieves the taxicab people from considerable embarrassment which resulted from the Supreme Court's decision that their machines were not "vehicles" within the meaning of the old law relating to public carriages and that therefore passengers did not have to pay fares unless they felt like doing so.

#### Four Clubs Elect Officers.

Automobile owners of Palatka, Fla., have formed the Putnam County Automobile Club and elected the following officers for the ensuing year: H. A. Davis, president; Dr. G. E. Welch, vice-president; W. T. Hamm, secretary; F. H. Wilson, treasurer; board of governors, the officers and H. M. Fearnside, F. W. Kells, T. J. Barnett. Fourteen names are on the charter list.

At the annual meeting of the Iowa Automobile Club of Des Moines, officers for the ensuing year were elected, as follows: John Gibson, president; W. W. Sears, first vice-president; Harold Wells, second vice-president; W. W. Reynolds, secretary; Frank Youngerman, treasurer; board of trustees, W. E. Moyer, C. R. Prouty, A. R. Rockwell, E. T. Meredith, C. C. DePew. The club has a hillclimb and a reliability contest "in the works."

Officers for the ensuing year have been elected by the Shamokin (Pa.) Motor Club as follows: C. Q. McWilliams, president; T. J. Mullen, first vice-president; G. W. Robertson, second vice-president; George W. John, secretary; Frank Llewellyn, treasurer. Arrangements have been completed for the club to join the Pennsylvania Motor Federation, membership in which carries with it affiliation with the American Automobile Association.

Reorganization of the Jacksonville (Fla.) Automobile Club has been effected and the following officers elected for the ensuing term: Dr. W. M. Stimson, president; Hobart C. Hare, vice-president; Marcus Conant, secretary; Herbert Race, treasurer. The club will incorporate, and plans are under way for the erection of a clubhouse near Ortega. An invitation from the Savannah (Ga.) Automobile Club to make a run to that city and be its guests was accepted, and June 6 was decided on as the date for the visit.

## "Great Western" <sup>Stock Car</sup> THE WINNER

On May 1st the "Great Western" driven by H. A. Stone won the 45 mile road race at Coalinga, Calif., making a 15 mile lap in 16 minutes and 59 seconds—59  $\frac{4}{5}$  seconds better than its nearest competitor. Experts concede this to be a World's Record over a course of this kind—the roughest upon which a road race was ever run. The Great Western 30 at \$1600 is an innovation. There is style, class, speed and reliability shown in these cars, which mark a new era in the automobile history.

A proven dependable 5 passenger touring car that has stood every test ever demanded of an automobile. The specifications prove the standardization, but you cannot know the exclusive features, the improvements and the refinements until you have seen the car and had an actual demonstration. The Great Western 30 is a big, noiseless, easy riding, comfortable, aristocratic car. The power plant is unexcelled by that of any car at any price. The low cost of up-keep

of the Great Western 30 is a feature that challenges comparison. Write today for open territory. It is limited. Prompt action is necessary.

# Great Western

## \$1600

### HORSEPOWER

—30, four cylinder, four cycle, water cooled, five bearing crank shaft of ample proportions,  $\frac{4}{4}$  inch bore, 5 inch stroke. TRANSMISSION—Sliding gear selective type, three speeds forward and reverse, locking device. Timken bearings. SHAFT DRIVE—Enclosed in tubular housing. CLUTCH—Cone type. Underneath a composition face that insures smoothness and efficiency. REAR AXLE—Semi-floating, with bevel gear and pinion drive. FRONT AXLE—Drop forged I-beam section, special steel in a single piece, with spring seats forged integral. DROP FRAME—Pressed steel with sub-frame, narrower in front to permit of short turns. WHEELBASE—112 inches. TREAD—56 inches or 60 inches. WHEELS—34 inches, artillery type, large spokes, quick detachable rims. FRONT SPRINGS—38 inches, semi-elliptic. REAR SPRINGS—42 inches, three-quarter scroll elliptic.

### BRAKES

—Two separate—one internal expanding, the other external contracting, operating on pressed steel drum, large and efficient. BODY—Five-passenger, with plenty of room in the tonneau; divided front seats. COLOR—Deep coach blue, elegantly finished and upholstered. GASOLINE CAPACITY—17 gallons. LUBRICATION—Gear-driven oil pump, integral with crank case. Nothing to adjust—very economical. COOLING—Radiator with gear driven centrifugal pump, ball bearing, detachable fan. CONTROL—Spark and Throttle levers on top of steering wheel—foot accelerator. EQUIPMENT—Magneto, five lamps, generator, tool box, robe rail, horn, full set of tools and tire repair kit.

Peru, Indiana

## RECENT PATENTS.

955,353. Carburetter. William R. Park, Taunton, Mass., assignor to the United Injector Co., New York, N. Y., a corporation of New York. Filed July 31, 1909. Serial No. 510,563.

In a carburetter the combination of casing having a vertical straightway gas passage, a fuel inlet pipe surmounted by a spray nozzle centrally located in the gas passage, a throttle valve above the fuel inlet, the gas passage provided with air ports at its bottom, a tubular sliding gravity valve of weight to correspond with desired manometric pressure at the delivery end of the fuel nozzle and controlling the air ports, parallel rods slidably mounted in the casing, adjustably connected outside the casing, one resting on and actuated by the air valve, the other provided with a needle valve controlling the fuel inlet, to increase and decrease the fuel inlet opening as the air-opening increases and decreases.

955,602. Motor Vehicle. Francis A. Messler and Maurice Bollstrom, Battle Creek, Mich. Filed Dec. 12, 1908. Serial No. 467,222.

1. The combination with an axle; wheels; spindles therefor pivoted on said axle, said spindles being provided with upwardly projecting arms; a driving shaft; a driven shaft made up of sections; compensating gear driving connections for said driving shaft and said driven shaft sections; bearings for said driven shaft sections arranged on said axle; gears; bearings therefor arranged on said upwardly projecting arms on said spindles; universal joint driving connections for said driven shaft sections and said gears; and internal and external gears on said wheels arranged to mesh with said gears on said spindles.

955,624. Fender for Automobiles. Dante J. Welton, Columbus, Ohio. Filed Dec. 8, 1909. Serial No. 531,922.

1. In a fender, the combination of a resilient impact member, a seat for the same, and the supporting bar 9 having its ends bent to form S-shaped springs and means for connecting said seat with said springs, substantially as described.

955,634. Anti-Skidding Tire. John Corwin, Chicago, Ill. Filed Feb. 13, 1909. Serial No. 477,581.

The combination with a tire body of a plurality of tread plates arranged diagonally across the tread surface thereof and lying closely together, each of said plates having a rib extending the full length of each lateral margin, and a centrally disposed tread portion extending parallel with said ribs and of a greater height, said ribs and tread portion providing a pair of parallel channels in the plate which open from the ends of the plate.

955,692. Pneumatic Spring Suspension for Vehicles. George A. Rhoads, Uhrichsville, O. Filed May 25, 1909. Serial No. 498,157.

1. A cushioning support for motor vehicle bodies comprising a U-shaped casting, said casting embodying vertical end portions cored to form cylinders and an intermediate base bar connecting with the lower ends of said cylinders, said bar being provided with a longitudinal bore forming an equalizing passage communicating with the chambers of the cylinders, pistons operating in said cylinders, a bar pivotally connecting said pistons, and a brace depending from the bar into the space be-

tween the pistons and providing means of attachment to the body supporting part of a vehicle.

955,709. Speed Indicator. Charles Spratt, New Cross, and Francis J. Shenton, Thornton Heath, England. Filed March 8, 1909. Serial No. 482,100.

1. In a speed indicator, the combination with a casing having a pointer rotatably mounted at one side thereof, of a shaft arranged within the casing and provided with a ball-carrying receptacle and means for communicating motion to the pointer from the balls within said receptacle upon the rotation of the shaft.

955,717. Reversing Gearing. Wilhelm Struck, Berlin, Germany. Filed Feb. 10, 1909. Serial No. 477,193.

1. In combination a driving shaft, a clutch member fast thereon, a driven shaft, a second clutch member movable longitudinally thereof, a casing connected with the fast clutch member and inclosing the movable clutch member, a movable pressure disk within the casing, yielding means for transmitting the movement of said disk to the moving clutch member, arms pivoted to the casing and bearing on the pressure disk, and means for moving said arms into positions perpendicular to the disk to move and lock said disk in clutch engaging position, substantially as described.

955,747. Electric Terminal Clip. William Barcy, Detroit, Mich., assignor to Barcy-Nicholson Co., Detroit, Mich., a corporation. Filed Nov. 8, 1909. Serial No. 526,762.

1. An electric terminal clip, comprising a plurality of correspondingly indented parts, through the flanged central portion of one of which the stem of a spark plug is adapted to pass, and the other of which is adapted to removably engage about the flanged central portion of the first named member, and to resiliently interlock with the correspondingly indented portions thereof, substantially as described.

955,831. Armor for Tires. Charles E. Titus, Springfield, Mass. Filed Aug. 28, 1907. Serial No. 390,501.

1. An armor for pneumatic tires comprising a plurality of abutting tread elements each provided with protuberances, and a plurality of arresters interposed between a plurality of adjacent tread elements.

955,845. Ignition Timer. Herman I. Broedling, Dayton, O. Filed June 11, 1909. Serial No. 501,487.

1. In an ignition timing device, the combination with an outer casing having an electrical terminal mounted thereon, of an inner rocking head having a contact mounted thereon, a leaf spring brush forming an electrical connection between the terminal on said casing and the contact member on the rocking head, and a rotating shaft having a contact member thereon adapted to engage said rocking head contact during the rotation of said shaft.

955,848. Roller Bearing. George A. Carter, Nephi, Utah. Filed May 14, 1909. Serial No. 496,054.

1. A bearing of the class described comprising a casing, having removable ends, a peripheral shoulder disposed centrally within said casing, a shaft extending therethrough, rollers in frictional engagement with said shaft and said shoulder having reduced ends, and channeled rings comprising two hinged sections provided with a plu-

rality of openings and supported upon the reduced ends of said rollers, the inner flange of said rings being split.

955,858. Gearing. Norman P. Fraser, Carsonville, Mich. Filed June 29, 1909. Serial No. 505,005.

1. The combination with a worm, of a gear in a mesh therewith, said gear comprising spaced toothed plates in mesh with the worm, and a yielding toothed plate mounted between said plates and in mesh with the worm.

955,888. Roller Bearing with Combined Thrust and Bearing Rolls. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Co., Harrison, N. J., a corporation of New Jersey. Filed March 26, 1909, Serial No. 485,972. Renewed March 12, 1910. Serial No. 549,009.

1. In a roller bearing, the combination, with a hub having a groove at the middle of its length with roll-seats at opposite sides of the groove, of two sets of rolls fitted to the roll-seats with their ends in contact over the groove and flanges upon the contiguous ends of the rolls fitted to revolve in the said groove.

956,061. Automobile Wagon. Martin V. B. Ethridge, New York, N. Y. Filed July 10, 1907. Serial No. 382,973.

1. A vehicle, a transverse shaft extending across the same and interrupted by an equalizing gearing, a sleeve external to the shaft and normally at rest and connected to the equalizing gearing whereby power transmitted to the sleeve at any point is conducted to the shaft at all points, a motor shaft, a worm actuated thereby, a worm gear loosely mounted on the sleeve and meshing with the worm, a sprocket wheel loosely mounted on the transverse shaft, an operating connection between the motor shaft and the sprocket wheel, a clutch slidably mounted on the sleeve and adapted to be thrown into engagement with the worm gear, to move the transverse shaft at slow speed forward and to be thrown into engagement with the sprocket wheel to move the transverse shaft at high speed forward at the will of the operator.

### ALLEN-KINGSTON GETS DAMAGES

**Sues Bankers for Alleged Fraud and Recovers \$26,919.58—Gave Contract to a Bankrupt Concern.**

After a trial lasting six days, a verdict for the Allen-Kingston Motor Car Co., of New York, for \$26,919.58 was returned by a jury in the Supreme Court on the 25th ult., before Justice Rogers, sitting in New York City. The defendants in the Allen-Kingston company's suit for alleged fraud and against whom the verdict operates are William O. Allison, president of the National Reserve Bank, formerly the Consolidated National Bank of New York; Elverton R. Chapman, president of the Hudson Trust Co., and Thomas J. Lewis, cashier of the National Reserve Bank.

The defendants were charged with having represented falsely to the Allen-Kingston company that the New York Car & Truck Co. was "a solvent going concern in sound financial condition" when they knew otherwise. Relying on these representations, the Allen-Kingston company permitted an assignment of its contract with the Kingston Motor Car Co. to the New York Car & Truck Co., the latter assuming the task of making motor cars for the Allen-Kingston company. A \$25,000 deposit by the latter company was involved, part of which was paid to the Kingston Motor Car Co. and the balance to the New York Car company. Like the Kingston Motor Car Co., the New York Car & Truck Co. failed to deliver the automobiles according to contract, and was put into bankruptcy by the defendants, who had vouched for its solvency.

### Gray Loses and Gains a Partner.

Although the firm name will remain unchanged, William Gray, of Gray & Davis, Amesbury, Mass., has lost a partner and gained one. The partner whom he lost is

Lambert Hollander; the one whom he gained is S. Preston Moses, a Boston shoe wholesaler, who also is Gray's close personal friend. Mr. Moses purchased Mr. Hollander's interest, the latter gentleman having decided that he is old enough to retire from active business and who will sail for Europe about July 1st. The manufacture of Gray & Davis lamps will be continued, of course, exactly as heretofore.

### Johnston to Manage White Branch.

R. H. Johnston has been appointed manager of the New York City branch of the White Co., of Cleveland, succeeding George W. Bennett, who resigned to become general sales manager of the Willys-Overland Co., of Toledo, O. As publicity and advertising manager, Johnston has been identified with the White Co. since 1903. F. A. Barker, whom Bennett succeeded in the Willys-Overland establishment, is to devote himself to the recently formed Great Northern Life Insurance Co., of Toledo, of which he is president.

### Mysterious Association Chooses Officers.

By circuitous channels it has leaked out that the mysterious and secretive Association of Motor Car Manufacturers, at its recent meeting in the office of a Detroit attorney, really elected officers. Its president is Manager Dalton, who represents the Flint Wagon Works, of Flint, Mich., while J. G. Bayerlein, general manager of the Warren-Detroit Motor Car Co., Detroit, Mich., is secretary, and John B. Chaddock, an attorney, is treasurer.

### Two More Selden Licenses are Granted.

After a period of idleness, the Licensed mill was started in motion again for a short time yesterday afternoon (Wednesday), when at the meeting of the executive committee of the Association of Licensed Automobile Manufacturers it ground out two more Selden licenses. The two additions to the list of licensees are the Interstate Automobile Co., of Muncie, Ind., and the Kissel Motor Car Co., of Hartford, Wis.

### WILLYS EFFECTS A COMPROMISE

**Buys Out Forbes and Campbell, Who Will Withdraw Suits—Partial Reorganization is Planned.**

Peace has been restored between John N. Willys, president of the Willys-Overland Co., of Toledo, O., on the one hand, and Thomas P. C. Forbes, Jr., and Henry F. Campbell, on the other, with the result that the suits which Forbes and Campbell brought against Willys and the American Motor Car Sales Co. in the courts at Indianapolis for an accounting, an injunction and damages, are to be withdrawn. A compromise arrangement has been effected for the settlement of the difficulties, Willys having bought out the complaining interests. This move is to be followed by a partial reorganization of the companies over which he has control.

Indicating that Forbes and Campbell have been hampering his operations for some time, Willys declares that two months ago they made him a proposition to buy them out for \$2,000,000. In turn he offered to sell out to them at the same rate, but they refused to be diverted from their offer.

"This proposition I flatly refused," says Willys. "Their actual investment with me was \$40,000 and I told them I would not stand to be held up. I offered them \$450,000 for their stock in the sales company, but they declined to accept and then I told them to go ahead and sue.

"There was absolutely no ground for the sensational charges they made in their petitions, but I suppose they inserted these charges to embarrass and frighten me and make me come to their terms. I finally compromised rather than engage in prolonged litigation with its consequent notoriety, and now the decks are cleared for action. I have bought them out and I now own all but 243 shares of the 20,200 shares of the different companies. These 243

shares are in the possession of the men who are working with me in the company in Toledo.

"I am going to reorganize all the companies into the Willys-Overland Co., of Toledo. The capital of this company is now \$2,000,000, of which \$1,200,000 has been issued. The other \$800,000 is to be issued to the Overland Automobile Co. of Indianapolis, and when that is done the latter concern will be turned over to the Toledo company, making but one corporation with a capital of \$2,000,000 with \$100 as the par value of each share.

"I am not sorry the Indianapolis stockholders of the American Motor Car Sales Co. filed the suits against me, for it brought things to a show-down and placed me in a position to get rid of them and reorganize the company along the proper lines with one big concern to handle the Overland business."

#### More Tires Coming from Pennsylvania.

For the manufacture of automobile tires the J. Ellwood Lee Co., an old-established rubber concern of Conshohocken, Pa., is building a two-story concrete factory on a site recently purchased about a mile outside of Philadelphia. The plant is to have a capacity of 500 casings and 1,000 tubes per day. For some time the company has been making white, single cure, wrapped tread tires, known as the Jelco, the production being about 20 a day; but upon the completion of the new factory the concern will add what it styles the Paynter non-skid tire, having grooves and suction cups in the tread.

#### Texas Makers to Enlarge Operations.

The Southern Motor Car Co., of Houston, Tex., has effected a reorganization and elected a new set of officers, following the additional subscription of \$40,000 worth of the original \$60,000 capital stock. The company was formed in July, 1907, and has been making the Dixie car. With the additional capital now available it will enlarge its manufacturing facilities considerably. The new officers are Will G. Brown, president; E. M. Pavey, vice-president and general manager; S. Fred Thompson, second vice-president and sales manager; E. E. Parson, secretary and treasurer.

#### Germans Seeking the Homo Rights.

Reversing the somewhat too familiar process of "borrowing" foreign ideas for American consumption, it is noteworthy that the manufacturers of the Benz car for some little time has been using the "Homo" mixing device on the carburettors of its racing cars in various contests abroad. So successful has been the result, it is said, that the concern has made application to the Gasolene Motor Efficiency Co., of Jersey City, N. J., manufacturers of the Homo, for the selling rights covering the entire European territory.

## BRANCH FACTORY IN SOUTHWEST

### Fort Worth is Told that Overland Will Establish One There—Cash Bonus and Factory Site.

Significant in indicating that the "Great Southwest" is regarded as a coming automobile market, in line with the remarkable demand already evinced this year, a branch factory for Overland cars is to be established in Fort Worth, Tex., by the Willys-Overland Co., of Toledo, O., according to the announced plan of John N. Willys, its president.

As previously told in the Motor World, Willys was in Texas a few weeks ago, with an eye to locating a branch factory in that State, and Fort Worth among other cities was favorably regarded. Since that time the Fort Worth boomers themselves have taken the initiative and have raised \$100,000 in cash and found a free factory site as an inducement to the Willys-Overland Co. to select their town rather than Houston, Dallas, New Orleans or other Southwestern rivals.

Following a visit by a delegation of these Fort Worth "boosters," headed by Mayor W. D. Davis and H. T. Edgar, of the Fort Worth Board of Trade, a second trip to Fort Worth was made by Willys, and at a banquet given to him before his departure, he declared the Board of Trade's offer of cash and land entirely satisfactory.

"The Southern assembling plant of the Overland will be located in Fort Worth," Willys told the local men. "Fort Worth's offer will without doubt be accepted, although a definite answer cannot be delivered for a couple of weeks because of some matters pending in the East. If everything works out as it is planned, the plant will be in operation long before the first of the year and will employ not less than 400 men in the beginning."

#### Huge Addition to Firestone Plant.

Work has commenced on the erection of a \$500,000 plant in South Akron for the Firestone Tire & Rubber Co., of Akron, O. The main building will be 360x265 feet and five stories high, while the power house will be a separate building, 150x100 feet. The specifications with the contractor provide that the building must be ready by the first of January.

#### Findlay Sees Fourth Factory Coming.

Prospects of a fourth automobile factory in Findlay, O., are elating the citizens of that place, as another company has been organized in addition to the Adams Brothers Motor Truck Co. and the Findlay Motor Car & Carriage Co., which already are actively producing, and the Findlay Motor Car Co., recently organized by L. E. Ewing,

of Cleveland, and which has taken the Findlay Axe & Tool Co. plant. The newest enterprise is to be known as the Findlay Automobile Co., and has been incorporated with \$10,000 capital by Merle N. Poe, Lewis D. Firmin, F. E. Hurley, C. L. Fleming and G. E. McCullough, all young business men of Findlay. The company plans to make commercial vehicles for both light and heavy service.

#### Demotcar Runs Short of Cash.

Creditors of the Demotcar Co., of Detroit, Mich., have been called into conference to consider whether it is best to close it out or to let it continue. A committee of three has been appointed to make a thorough investigation of the concern's affairs. The liabilities are placed at \$174,000, but the officers maintain that the assets exceed this amount and that the company's difficulties are due chiefly to a lack of cash capital. The company makes a low-priced car and also had a lot of stock certificates for sale.

#### Garage Owners Choose Directors.

Charles D. Case has been appointed manager of the newly formed Garage Owners' Association of New York, to which only garage concerns in New York City and its vicinity are eligible. The directors chosen for the coming year are G. Edward Shaw, Columbus Garage; D. L. Dean, Uptown Garage; W. D. Carleton, Co-Operative Garage; I. D. Siegel, Taxicab Auto Co.; C. S. Bader, Imperial Garage; W. S. Horner, Harlem Automobile Co., and Austin P. Palmer, Knickerbocker Garage.

#### New Head for Anhut Company.

The Anhut Motor Car Co., of Detroit, Mich., has been reorganized, John Anhut having been placed in charge of the sales department and being succeeded as president by William Walker, of Walker Bros., caterers. Charles E. Hinkle has been made secretary.

#### Velie to Build its Own Motors.

The Velie Motor Vehicle Co., of Moline, Ill., has made arrangements for the building of shops for the manufacture of gasolene motors for its cars. The company heretofore has obtained its engines from outside sources.

#### Pennsylvania Opens Branch in Detroit.

The Pennsylvania Rubber Co. has established a branch house in Detroit at 882 Woodward avenue. It is in charge of George E. Goble, who previously represented the company in the Middle West.

#### Sands to Manufacture Self-Starters.

The Sands Specialty Co. has been organized in Cleveland, O., to manufacture the Sackman self-starter for motor cars. W. H. and C. M. Sackman are the moving spirits in the enterprise.

## APRIL PROVES BIG EXPORT MONTH

Rapid Swelling of Foreign Trade Continues  
—Canadians Buy Heavily—Gains in  
Most of the Divisions.

The high record in the export of automobiles from the United States, established in March, 1910, was broken in April, when the shipments attained a value of \$1,213,044, compared with \$720,423 during April, 1909. The total number of cars was 687, as against 478. The average value of exported cars increased from \$1,418 in April, 1909, to \$1,523 in the same month of 1910.

The heaviest buyer of American-made cars, as for some time past, was British North America, which accounted for \$547,646 worth, compared with \$199,798 in April, 1909, showing an increase of 175 per cent. On the other hand, a slight falling off was registered in the trade with France, which took \$106,689 worth, as compared with \$121,773 in the same month of last year, and Other Europe, which accounted for \$62,433, as against \$75,044. Small losses were shown by Mexico, British Australasia and Other Countries, but their aggregate amount was but \$24,294. Great Britain once more increased its purchases of American cars, buying \$206,976 worth as compared with \$163,101 in April, 1909. Germany, also, after a period of light buying, invested more heavily, taking \$36,988 worth, as against \$8,487 in the same period of 1909. Italy, too, increased its imports from \$25,700 to \$71,891.

During the ten months ending April, 1910, every one of the fourteen geographical divisions took more than in the corresponding period of the last year. British North America leads, with \$3,057,456, as against \$1,123,273 for the same months of 1909, and is far ahead of the United Kingdom itself, the next largest customer.

The total for the ten months of the fiscal year was \$7,595,315, as against \$3,999,459 for the previous corresponding period, while the cars numbered 4,867, as against 2,008. The record in detail follows:

	April		Ten months ending April		
	1909	1910	1908	1909	1910
Automobiles and parts of—

## Changes Effectuated in Pennsylvania Rubber.

The Pennsylvania Rubber Co., Jeannette, Pa., has increased its capital stock from \$1,500,000 to \$2,000,000 and is making ready to enlarge its plant. Incidentally, Herbert DuPuy, president of the Crucible Steel Company and for years one of the most widely known men in the steel industry, has assumed the presidency of the Pennsylvania company. Seneca G. Lewis, who recently joined the company as sales manager, has been made general manager, and C. M. DuPuy, formerly sales manager, has been made general manager, and C. M. DuPuy, formerly sales manager, has become vice-president. H. W. DuPuy retains the office of treasurer. These changes are expected to achieve results that will cause them to be felt in many places.

## Owen Organizing His Sales Staff.

J. B. Hulett has been appointed Western sales manager for the Owen Motor Car Co., of Detroit, Mich. He resigns as sales manager of the Robertson Motor Car Co., of Minneapolis, Minn., to accept the new position. The Owen company also has engaged C. E. Wheeler, formerly with H. H. Franklin & Co., as a traveler in the territory east of Buffalo, and E. O. Durfee to take care of Southern territory.

## Lewis and Bate Back from Europe.

William Mitchell Lewis, president of the Mitchell-Lewis Motor Co., of Racine, Wis., and John W. Bate, the designer for the company, have returned from their European sojourn. While abroad Bate visited a number of Italian and French automobile factories for the purposes of observing the most recent developments in European design and manufacturing practice.

## To Enlarge Wisconsin Radiator Plant.

After manufacturing radiators for some time in a small way, the Wisconsin Automobile Radiator Co., of North Milwaukee, Wis., has been incorporated with \$55,000 capital, by Gerhard Aussem, S. S. Lendt and Arthur Zancig, all of North Milwaukee, and will considerably enlarge its operation. A large factory is to be erected at once.

## SECRETS OF TIRE PRICE CUTTING

They Are Revealed to Remove a Visitor's  
Doubts as to "Bargains"—Why  
Casings Are Nameless.

Alluring in a degree, the advertisements of a number of cut-price tire houses, who sell nothing but tires, are so apparently remarkable in their offerings that a Motor World man paid a visit to one of the colony which holds forth in the Thoroughfare building, at Broadway and 58th street, near Columbus Circle, in order that he might get information as to the often-asked question of "How can they do it?" What he saw and his interview with the salesman may help throw light on the nature of the tire offerings on which concerns of this kind find it possible to quote such tempting figures.

In the Thoroughfare building there are about half a dozen cut-price companies selling tires, each company operating under a different name and in competition with the others, but it is more or less an open secret in Automobile Row that most of them have a common inspiration and, dependency on one man, named Max Zeigler, whose relatives and connections form the respective crews for the different enterprises. The Crescent Tire Co., Inc., on the ground floor, was the place visited, as being in a degree representative of them all.

"What price can you make on a Goodrich 34x4 quick detachable?" the Motor World man asked the brisk salesman, who looked as though he might be a Zeigler. The regular consumer's price for such a tire is \$43.65, so that price comparisons easily could be made.

"Just step this way," said the salesman, leading the path through the cramped quarters of the place back to the tire racks. Reaching into the racks, he pulled down a casing and said: "Now there is what you want and our price is \$20."

Surely here was a bargain indeed; so the investigator stepped closer to examine it. The casing was fairly bathed in talc powder, so that superficially it looked quite white, but at those points where the talc was rubbed off, and on the inside it reminded the investigator of ebony or teakwood, which it also seemed to resemble in the qualities of soft, fresh resiliency. Close inspection failed to reveal the Goodrich name, there being no lettering on the tire except a "34x4" size mark in large figures.

"I don't see the Goodrich name on the tire," the visitor declared.

"Ah!" exclaimed the salesman, who was evidently prepared for such an objection. "You see, they would not let us sell the tire at that price if the name was on it. We have to take the name off before we can sell the tire at this low figure. They

got overstocked on this size (34x4), just like any other factory will get overstocked on a size, and so we are helping them to get rid of the surplus in this way. But they don't want their name on them."

It was news that any factory should become overstocked on the one size that above all others is most in demand among tire users, but the Motor World man did not comment on it.

"Now here is an Ennis tire at the same price," said the tire man. The tire was a very close match for the first one, except that it had the Ennis name on it, indicating that it had been made by the Ennis Rubber Co., which at last accounts was in the hands of a receiver. Dismissing the Ennis proposition, the visitor reverted to the first tire.

"How do I know that this is a Goodrich?" was asked.

"We guarantee it to be a Goodrich," was the reply, but nothing more was forthcoming as to the terms or backing of the guarantee.

"Well, is this tire a second?" the inquirer continued.

"It is part of the Goodrich factory overstock, like I told you," explained the salesman; "but if you want to call it a second, why, I'll sell it to you as a second. Yes, I'll sell it to you as a second, but it is just the same as a first only it hasn't got the name on it, because we are selling it at a low price. If you want one with the name on it I can get it for you just as it comes from the Goodrich company, with serial number, and guaranteed, and everything like that, for \$40. But what good is a guarantee to you? You can get two tires like I showed you for the price of a guaranteed tire, so it's worth taking a chance on, isn't it?"

#### Will Distribute Commercial Cars.

The Car Makers Selling Co. of New York has been organized in New York City, to act as Eastern distributors for Dart and other commercial vehicles. The company has a working arrangement with the Car Makers Selling Co. of Chicago, Ill., which controls the output of several factories. Its officers are George L. Derr, president; J. A. Clark, vice-president, and D. McL. Miller, secretary and treasurer. Offices have been taken in the Goodrich building, 1780 Broadway.

#### Sproehle to Locate in Frackville.

The Sproehle Mfg. Co., of Philadelphia, Pa., which has been making automobile parts and which controls a number of patents relating to gears, radiators and a rotary engine invented by F. J. Sproehle, is negotiating with Frackville, Pa., for the erection of an automobile plant. The local board of trade has donated a factory site and the Sproehle company, which is raising its capitalization to \$2,000,000, has promised to accept.

#### The Week's Incorporations.

Detroit, Mich.—Rotary Valve Motor Co., under Michigan laws, with \$100,000 capital.

Bridgeton, N. J.—Hann Automobile Co., under New Jersey laws, with \$50,000 capital; to manufacture automobiles, etc. Corporators—H. L. Howell, C. D. Stowell, Charles A. Hann.

Springfield, Mass.—Automobile Lighting Co., under Massachusetts laws, with \$30,000 capital; to manufacture automobile apparatus. Corporators—H. W. Field, Matthew N. Ryan, C. P. Lyman.

Wellesley, Mass.—Wellesley Auto Transit Co., under Massachusetts laws, with \$25,000 capital; general automobile business. Corporators—W. H. Pfeffer, South Natick; C. N. Taylor, Wellesley.

Chicago, Ill.—International Automobile League of America, under Illinois laws, with \$2,500 capital; automobile owners' legal defence. Corporators—S. W. Newman, Hyman Soboroff, I. J. Bliss.

Chicago, Ill.—Hayes Avenue Garage Co., under Illinois laws, with \$5,000 capital; to do general automobile business. Corporators—Charles Kleinfelder, Alfred R. Pearson, Charles B. Obermeyer.

Detroit, Mich.—Hale Motor & Machine Co., under Michigan laws, with \$125,000 capital; to manufacture automobiles and parts. Corporators—S. E. Hale, Chas. Ritter, J. L. Hudson and others.

Northampton, Burlington County, N. J.—Mt. Holly Garage, under New Jersey laws, with \$100,000 capital; to operate a garage. Corporators—Walter T. Stewart, Ellis H. Parker, W. Roland Warrick.

Buffalo, N. Y.—Dixon Motor Car Co., under New York laws, with \$15,000 capital; general automobile business. Corporators—John C. Dixon, Robert A. Meyers, Arthur L. Dixon, all of Buffalo, N. Y.

Lynchburg, Va.—Automobile Sales Co., under Virginia laws, with maximum capital \$15,000, minimum \$1,000; general automobile business. Corporators—S. Leftwich, G. T. Tomkins, J. M. Gerow.

Auburn, N. Y.—Auburn Ignition Co., under New York laws, with \$25,000 capital; to manufacture and deal in automobile appliances. Corporators—E. A. Raves, William Franke, Charles A. Franke.

Portland, Me.—Portland Motor Mart & Amusement Co., under Maine laws, with \$50,000 capital; to deal in automobiles and appliances. Corporators—R. T. Whitehouse, W. E. Whipple, B. T. Whitehouse.

Greensburg, Ind.—Hamilton Motor Car Co., under Indiana laws, with \$50,000 capital; to manufacture and deal in automobiles. Corporators—H. W. Hamilton, C. P. Corbett, W. W. Bonner, H. T. Woodfill, D. A. Myers.

Boston, Mass.—Waite-Robbins Motor Co., under Massachusetts laws, with \$25,000 capital; general automobile business.

Corporators—F. R. Robbins, Brookline, Mass., and others.

Chicago, Ill.—Charles H. King & Co., under Illinois laws, with \$5,000 capital; automobile garage, storage and repair business. Corporators—Charles H. King, A. L. Dustin and M. Nelson.

Racine, Wis.—The Case Co., under Wisconsin laws, with \$100,000 capital; to manufacture engines, automobiles, etc. Corporators—F. K. Bull, R. T. Robinson, F. Lee Norton, William F. Sawyer.

Minneapolis, Minn.—Girling Motor Co., under Minneapolis laws, with \$25,000 capital; to operate an automobile passenger service between Minneapolis and Anoka. Corporators—Thomas H. Girling and others.

Lynn, Mass.—R. H. Messer Co., under Massachusetts laws, with \$7,500 capital; general automobile business. Corporators—Charles H. Morrill, Robert H. Messer, Stephen H. Tierney; Santry & Santry, attorneys.

New York City, N. Y.—Harper Engineering Co., under New York laws, with \$50,000 capital; to manufacture and deal in engines, automobiles, motor boats. Corporators—E. F. Berkeley, W. Harper, Jr., A. J. Clayton.

New York City, N. Y.—Eastern Auto Distributing Co., under New York laws, with \$1,200 capital; to manufacture and deal in automobiles, carriages, etc. Corporators—Leonard K. Clark, Albert C. Baldwin, Stephen C. Piero.

Dayton, Ohio—Mead Engine Co., under Ohio laws, with \$1,000,000 capital; to manufacture newly invented automobile engine. Corporators—Cyrus G. Mead, Adam Schanze, Edward G. Pease, R. B. Dutch and Carroll Sprigg.

New York, N. Y.—New York Rotary Engineering & Accessories Mfg. Co., under New York laws, with \$50,000 capital; to manufacture motors, engines, taximeters, etc. Corporators—D. Davis, H. Katz, C. M. Lackland, Jr., all of New York City.

Harrisburg, Pa.—Wright Motor Car Co., under Pennsylvania laws, with \$5,000 capital; to manufacture and sell automobiles and motorcycles. Corporators—George H. Reiff, George F. Bobb, Samuel Prowell, E. M. Brennan, Thomas F. Rogers, John J. Rogers.

#### Increases and Decreases of Capital.

Chicago, Ill.—Ranger Automobile Co. increased capital from \$25,000 to \$50,000.

Milwaukee, Wis.—Monarch Motor Co. decreased capital from \$20,000 to \$10,000.

Monroe, Wis.—The E-Z Auto Go-Cart Co. decreased capital from \$50,000 to \$25,000.

North Milwaukee, Wis.—Wisconsin Motor Mfg. Co. increased capital from \$100,000 to \$200,000.

## IN THE RETAIL WORLD.

D. M. Huntington will open a garage in Grand Rapids, Mich.

Guthrie, Okla., is to have a new garage on Noble street. The Williams Bros. are building it.

Schuylkill Haven, Pa., is to have its first modern garage. H. R. Heim is building it on South Main street.

F. C. Wiswell, of Elkhorn, Wis., has opened a garage and repair shop in that town. E-M-F. cars will be featured.

J. C. Hebbe, Fort Atkinson, Mich., has entered the automobile field. His garage is in the Langholf building, 301 South Main street.

Saires & Perrine is the style of a new firm in St. Louis, Mo. They will do general repair work at 523 North Vandeventer avenue.

L. J. Hemington and R. H. Lee will erect a two-story brick garage opposite the court house in Fond du Lac, Wis. It will cost about \$4,000.

The Moore & King Co. is the style of a new firm which has established a garage in Pecos, Tex. The structure is 40x100 feet and built of cement.

F. H. Bloome is building a garage at 1114-1116 Race street, Cincinnati, O. The building is to be two stories high, of concrete, and will cost \$20,000.

George L. Babcock will open a new garage in Plainfield, N. J., next month. The building is of brick, steam heated and will cost, when completed, \$15,000.

The Empire Auto Repair Co. has taken possession of a new garage at 1317-1319 Second avenue, Spokane, Wash. Palmer-Singer and Rambler cars are displayed.

H. T. Lykes, of Tampa, Fla., is building a two story garage at the corner of Jackson street and Florida avenue. It will be 70x95 feet and will cost about \$12,500.

D. M. Wilson, H. Wilson and Waples Burton are building a "daylight" garage at State and King streets, Dover, Del. It will be 100x28 feet, of concrete and plate glass.

Frank J. Briquet, formerly with the Green Bay Motor Car Co., has opened a garage and repair shop at 215 Stuart street, Green Bay, Wis. He will handle the Kline Kar.

Charles M. Larsen has engaged in the automobile business in Waukesha, Wis., under the style of the Auto Supply Co. He will do repair work and rent cars as a side line.

Southworth Bros., automobile dealers and repairers, at Biddeford, Me., are building a three-story concrete garage on Preble street. It will be 150x100 feet and cost \$40,000.

The new salesrooms and garage of the Eureka Motor Car Co., at 257 Central avenue, Albany, N. Y., were opened last week.

Whiting, Cutting and "The Only" cars will be exhibited.

The Rehkopf Bros., wagon repairers, have entered the automobile field and installed a line of supplies and accessories. They are located at 207 West Sixth street, Wichita, Kan.

Clyde O. Maddox has resigned his position as manager of the New Home Telephone Co., Jacksonville, Ind., to enter the automobile business. He is building a garage in Linton, Ind.

Harvey Parker, a well known professional wrestler, has entered the automobile business in Worcester, Mass. As a side line he expects to stage some big wrestling bouts in New England.

M. Falk and Leo Stuts are completing the arrangements for the erection of a garage at the corner of Eden Glen and Lancaster streets, Leominster, Mass. The building will be of brick, 63x83 feet.

Joseph Curt, who some time ago formed the Anthracite Motor Car Co., in Scranton, Pa., has bought out his partners and is now sole owner of the business. He handles the Overland and Corbin cars.

Schmidt & Herres, of the New London (Wis.) Iron Works, have engaged in the automobile business and added a garage to their machine shop. Besides doing general repair work, they will handle the Overland car.

Fire destroyed the garage and machine shop of the Hood River Mfg. & Eng. Co., at Hood River, Ore., on May 18th. No automobiles were burned, although the loss of the machinery is said to have been considerable.

Jesse C. Bradley, president of the Excelsior Motor Car Co., of Milwaukee, Wis., has filed a voluntary petition in bankruptcy. He gives his liabilities as \$204,213 and his total assets as \$21,990, of which \$11,240 is exempt.

The Williams Automobile Co. has removed from Main and Washington streets to a new garage at Twelfth and Main streets, Los Angeles, Cal. Petrels, Brushes and Schacht delivery cars form its "stock in trade."

The American Automobile Co. of Boston, Mass., has established a service department on Green street, Cambridge, Mass., near the old Charles River Park bicycle track. Jack Andrews has been placed in charge.

The old Colonial garage at 214-216 North Jefferson street, Springfield, O., has been rebuilt and enlarged, and is now open for business. W. E. Childs, until recently connected with the Western Motor Co., is the new owner and manager.

Ollinger & Hollinger, automobile dealers in Salina, Kan., have purchased the natatorium and skating rink opposite the National hotel, and will erect there a modern

garage. The style of the firm formerly was the Ollinger Motor Car Co.

W. C. McNabb has sold his interest in the McNabb Iron Works, Atlanta, Ga., and purchased the National garage at 38-40 Auburn avenue, in that city. He will handle the Parry and De Tangle cars, in partnership with T. Stacey Capers.

What has been known recently as the Ripon Auto Co., Ripon, Wis., formerly styled the E. A. Butzke Carriage Works, has again changed hands. H. S. Hart has purchased the estate's interest in the firm and will continue to do general repair work.

The Standard Auto Co., of Houston, Tex., has moved into its new garage at 701-705 Rusk avenue, where it has a floor space of 20,000 square feet. The company has installed a complete day and night service, employing thirteen mechanics in the repair department.

V. W. Shuler, an oil speculator in the Illinois oil fields, has entered the automobile business and opened a garage at Sixth and Walnut streets, Oklahoma City, Okla. He calls it the Standard Auto Garage, and has acquired the agency of the "Standard Six" and Halliday cars.

J. T. Sweeney, who until recently was purchasing agent of the Times Square Automobile Co., of New York City, N. Y., has organized in Philadelphia the Sweeney Auto Co., with offices and garage at 208 North Broad street. He expects to do chiefly a business in used cars.

The Wheelock Auto Co., Fargo, N. D., has purchased the Gate City Auto Co. and taken over the latter's garage on N. P. avenue. Overlands, Hupmobiles and Knox cars, as well as accessories and supplies will be dealt in. The Wheelock company still retains its garage and store room on Front street, where most of the repair work will be done.

J. W. Scheuber, a wholesale cigar dealer of Fort Worth, Tex., has bought a controlling interest in the Vernon Motor Car Co., of that city. This company is a merger of the old Vernon company and the E. F. Simmons Co., and has the state agency for the Stevens-Duryea and the Everitt "Thirty," as well as sub-agencies for the Hupmobile, Oakland and Oldsmobile. Mr. Scheuber will direct the office end of the business.

Under the name of The Carl H. Page Associates, several of the officers and employees of the Carl H. Page Co., of New York City, have formed a separate company to represent Chalmers cars in Hartford, Tolland and Windham counties, Connecticut, with working headquarters in the city of Hartford. The company, which will obtain its cars from the Carl H. Page Co., includes Harry Unwin, Joseph Bell, Jr., Philip Baer, Joseph W. Ball, Dean Rankin, Vance Shearer and James J. McKenna.

# WHITE GASOLINE CARS

## for 1911

**SIZE AND POWER**—moderate, therefore, most economical to maintain.

**PRICE**—moderate, therefore, easy to buy.

**DESIGN**—includes many advanced features not found in any other American car.

**QUALITY**—The only moderate sized car wherein every part is just as well built as in the highest-price, high-powered cars.

**DELIVERY**—Very few open dates. First come, first served.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, JUNE 2, 1910.

### The Duties of Trade Journals.

If there be any ethics in automobile trade paper publishing, the Motor and Accessory Manufacturers, Inc., is taking a step which is calculated to throw at least one phase of them into bold relief. In a diplomatic way the association is "putting it up" to the publishers of automobile papers as to the propriety of publishing the advertising of "shysters" and cut-price houses and particularly those that advertise cut prices in actual figures.

It is good that the matter is to be made an issue, as it will serve to emphasize where some of the automobile publications stand in relation to cut-price houses and whether they recognize any duty to the legitimate trade. If they do recognize any duty which might imperil their income from cut-price houses, they in most cases ignore it, as their advertising pages testify in bearing cut-price announcements and exaggerated and clearly misleading statements.

It is somewhat remarkable that the issue has not been raised earlier, as the harm done by the appearance of such ads in trade papers is wide and mischievous in its extent. Printed in the great dailies the damage is limited to a restricted area; published in trade journals which reach into all parts of the country, the entire trade structure is affected and disturbed. All class journals are avowedly published in the interests of the particular classes or trades they represent, and yet there are not a few of them whose real policy practically is to let not a single dollar escape—to refuse no advertisement that is obtainable and to say nothing that will scare away a cent.

The failure of the legitimate trade to recognize the fact and to act accordingly is one of the things that really makes more difficult the way of the trade journal, such as the Motor World, which recognizes its whole duty and which seeks to fulfil it. In doing so, it must refuse the advertising of cut-price houses and decline to extend credit or advertising space to "shysters" whose ratings and records prove them unworthy of credit and support; it must expose the crooks, speculators, grafters and bubble-blowers, and generally turn light into dark corners and fight abuses of the trade whose interests it faithfully represents.

The performance of the duty entails the loss of thousands of dollars, and when the publisher of such a journal sees the legitimate trade, which respects itself and pays its bills, lending its patronage and giving its money to competitive don't-scare-away-a-dollar publications, he scarcely can be blamed for occasionally harboring what's-the-use thoughts. Generally speaking, the legitimate trade seems not to care nor to appreciate the difference between the true and the false. As the action of the Motor and Accessories Manufacturers is the first evidence to the contrary it cannot but be hailed with delight by all publishers who see their duty and do not fear the cost of performing it.

The Motor World sincerely hopes there will be no let-up in the M. A. M. campaign. It will quicken the consciences of publishers who have the dollar sign always before them and assure a higher order of trade journalism and more real service to the varied interests for which that term stands. Since its foundation, the Motor World has not only closed its columns to cut-price advertisements, but it has exposed the

crooks and grafters and speculators and "second-story men" who have infested the trade and who cast a blighting influence wherever they operate. The policy has enmeshed The Motor World in libel suits for sums as high as \$100,000, but neither suits nor threats of suits or vengeance have served to turn us from our conception of duty; nor will they serve to do so.

### The Lowering of Gear Ratios.

Although it is now some little time since the private motorist has taken a very active interest in the question of gear ratios, evidence is not lacking that the manufacturer has continued to study it with profit. One outcome has been that in a number of instances gear ratios have been lowered within a relatively short time, while it is the understanding that several other forthcoming new models will be lower geared than their immediate predecessors. Several reasons may be urged in favor of moderate gearing, all of them arguing improved running economy and prolonged life of the car. And it is a noteworthy point that, even though lowering the ratio of the final drive reasonably may be expected to lower the maximum possible speed of the machine, few complaints have resulted from the user in consequence of the change and the cars which have been altered in this way have lost no prestige, but rather have gained in certain other respects.

In a general way the movement is merely an incidental expression of the manufacturers' efforts to produce the utmost satisfaction in the mind of the user under average running conditions. Normal running is not done at high speed, but at what, according to modern definition, must be considered very moderate speeds. Despite the great amount of high speed running which is done on open roads, most of a car's mileage is made at rates well within reason and, all things considered, extremely uniform. Such being the case, it behooves the maker so to construct the machine that within the limited range which normal use prescribes, it will develop its best and most economical performance in every respect.

This, in a word, is the reason for reducing the gear ratio. It enables the motor to work to better advantage on high gear, affords a wider range of working conditions on the direct drive, improves its hill-climbing power, permits the engine to turn more rapidly at car speeds below that cor-

responding to the normal rate of engine revolution, and also caters to the present humor of the public, in permitting very low car speeds to be made in the direct drive.

For most purposes the only sacrifice made is that of high speed. But when it is considered that several of the more far-seeing and successful manufacturers have adopted the policy without sacrifice to their business, it is apparent that the movement is doubly significant; that it indicates not only the determination of the manufacturers to afford their products the most advantageous working conditions which it is possible to provide, but also that it reveals on the part of the average motorist of the better class a disposition to outgrow the craze for extreme high speed, which at one time threatened gross injustice and injury to the industry, and to be content with such speeds as, in the words of the law, are "careful and prudent."

One error into which owners of commercial vehicles are apt to fall is that of trusting too much to the judgment of the operator in matters connected with the upkeep and repair of the vehicles. Particularly if the owner has had experience with the trained chauffeur, of the type which has been developed in the pleasure car field, he may be apt to rely unduly on the man who is hired to run his business wagon. He should remember, however, that the latter generally is recruited from the ranks of the teamsters, and that he is not expected to have developed sound judgment or more than a nominal amount of wisdom in handling machinery. One of the aims of the commercial vehicle manufacturer is to reduce the utility vehicle to a point where it will give good service in untrained hands. The owner who places too much confidence in the ability of such a driver, however, is pretty apt to find his operating costs higher than should be expected, and that a considerable amount of time is lost on account of necessary repairs.

Among other things that seem to be overdone badly is the "pathfinding" stunt, preliminary to short tours or contests in well mapped and well known touring districts. If those who do it find it successful for their purposes, either in obtaining publicity for the cars used or in securing even more direct and tangible benefits, there can be no criticism of their wisdom, but it

## COMING EVENTS

June 3-4, Buffalo, N. Y.—Automobile races at Fort Erie.

June 4, St. Louis, Mo.—Automobile Club of St. Louis reliability contest.

June 4, Portland, Me.—Portland "Telegram" hillclimb on Morrison hill, West Cumberland.

June 4, Worcester, Mass.—Automobile Club of Worcester's annual hillclimb on Dead Horse hill.

June 4, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 6, Atlanta, Ga.—Start of second annual New York-Atlanta Good Roads Tour, ending in New York June 14.

June 6-9, Richmond, Va.—Richmond "Times-Dispatch" endurance run to Raleigh, N. C., and return; 420 miles.

June 7, West Haven, Conn.—Yale Automobile Club's third annual hillclimb on Shingle hill.

June 11, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hillclimb on Giant's Despair.

June 14-15, New York City—Motor Contest Association's biennial "Around Long Island" reliability run.

June 14-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

June 28-30, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' Association's endurance run for "Star" trophy.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wild-

wood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

June 11, Baltimore, Md.—Automobile Club of Maryland's hillclimb.

July 13, Winnipeg, Man.—Winnipeg Automobile Club-Winnipeg Motor Trades Association joint racemeet.

July 18-22, Milwaukee, Wis.—Wisconsin Automobile Association's first annual endurance test for "Milwaukee Sentinel" trophy.

July 30, Wildwood, N. J.—North Wildwood Automobile Club's race meet on Wildwood Speedway.

August 3-5, Galveston, Tex.—Galveston Automobile Club's beach races.

August 6, Philadelphia, Pa.—Quaker City Motor Club's race met at Point Breeze track.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

August 12-13, Indianapolis, Ind.—First 24 hours race on Indianapolis Motor Speedway.

August 15, Washington, D. C.—Start of second annual Frank A. Munsey reliability contest.

September 5, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

September 10, San Francisco, Cal.—Automobile Club of California's road race in Golden Gate Park.

September 10, San Francisco, Cal.—Automobile Club of California's Portola road race in Golden Gate Park.

September 17, Syracuse, N. Y.—Automobile Club of Syracuse-Syracuse Automobile Dealers' Association joint racemeet at Fair Grounds track.

September 18, Los Angeles, Cal.—Annual road race up Mount Baldy.

October 1, Mineola, L. I.—Sixth annual Vanderbilt Cup race on Long Island Motor Parkway, under the auspices of the Motor Cups Holding Co.

October 8, Philadelphia, Pa.—Quaker City Motor Club's road race in Fairmount Park.

October 15, Mineola, L. I.—Motor Cups Holding Co., 278 miles international road race on Motor Parkway, for the Grand Prize of the Automobile Club of America.

is time that those who are brought into contact with the alleged "pathfinders" and their plans should keep their eyes open as to the real character of some expeditions of the sort. Just why "pathfinding" should be necessary for trips over roads that are almost as well known as those in Central Park may not be apparent to the average

motorist, but light begins to dawn when it is pointed out that in some cases the "pathfinding" is chiefly for the purpose of arranging a "rake-off" from hotel proprietors along the route. To style such journeys as "pathfinding" or "blazing the trail" is an unwarranted euphemism for non-adventurous and sordid business trips.

## GREAT GOING AT INDIANAPOLIS

First Championship Meeting Supplies Fine Sport and 24 New Records—Aitken Wins Two Title Events—Enormous Crowds Attend.

That the  $2\frac{1}{2}$  miles brick-surfaced Indianapolis Motor Speedway, just outside the Indiana city of that name, is one of the fastest race courses in the world, there can

was proved by the Indianapolis meet. Records fell as chaff before a northern gale, and it is not exaggerating to state that never before in the history of automobile racing have so many records been wiped from the slate at a single meet. Not only were previous marks eclipsed, but in several instances new records were placed on the books one day only to be supplanted by better performances the following day.

Insofar as record-breaking was con-

On Friday, the first day of the meeting, the attendance was 15,000, which ensemble was increased to 25,000 on Saturday. As Monday was a general holiday, it was to be expected that the attendance would reach top notch calculations, but even the box office experts did not expect 60,000 persons to pass through the gates. Of this number, at least 2,500 came to the course in automobiles. Everyone seemed satisfied with the racing, which was peppery and full of thrills, in contradistinction to the runaways that have characterized other meetings.

For the first time in the history of American automobile racing a strict interpretation of the rules as regards stock models was insisted upon, and the microscopic search of the technical committee of the American Automobile Association caused some hard feelings among a few of the proposed entrants. Their rulings, though apparently exacting to those affected, were no more than just to those manufacturers who had complied with the rules. The technical gentlemen passed upon the entries the day before the meeting and declared the Buick models 16A, 16B and 100, the Jackson model 30, the Westcott model F, the Cutting model 50, the American Speedster, the Fuller 1911 Roadster, and the Empire 1911 model C, had not been produced in sufficient quantities to entitle them to be regarded as stock models. These cars accordingly were barred from the events in which they had been entered.

First Day—May 27th.

To win an event and not know it was

HOW THEY LOOKED COMING DOWN THE STRETCH

be no doubt. The three days' meeting there on Friday, Saturday and Monday last, May 27, 28 and 30, proved the claim beyond possible argument, and incidentally the three days' meeting will be inscribed in the pages of automobile race history as one of the most successful meetings ever held in America if not in the world. Not only were a great many American speedway records broken and further annihilated, but the combined attendance of the three days far surpassed any similar occasion in America. In addition to the records established for speed and attendance, the occasion was, incidentally, the first automobile championship meet ever held in America and six titular events were decided, with five different drivers figuring in them.

John Aitken, who pilots a National as well if not better than any other driver could do, was the only knight of the steering wheel to pluck two championships; he captured both the 5 and 10 miles titles for cars between 301 and 450 cubic inches piston displacement. Aitken was not the only champion that was created at the meet, however, as Harroun and Dawson, both reliable Marmon cracks, won the 10 and 5 miles title races for cars within the 231-300 cubic inches class, and Chevrolet, the erratic Frenchman, succeeded in capturing the 10 miles championship for cars in the 161-230 cubic inches class. The only championship event for cars in the 451-600 cubic inches class was at the 10 miles distance and the Knox car, with Oldfield up, annexed the honor.

That the manufacturers have not been idle during the past few months certainly

cerned the honors were not one-sided. It is true that Marmon cars set up 15 of the 24 new marks, but they were divided between two drivers—Harroun and Dawson—while the National cars, ably piloted by Kincaid and Aitken, also succeeded in obtaining their share of records. The Knox, too, figured in the discomfiture of Father

CLOSE FINISH IN 10 MILES EVENT, AITKEN WINNING

Time. The old gentleman was sadly battered.

As regards attendance the gate receipts surpassed even the expectations of the promoters. The Indianapolis Motor Speedway has cost the builders an immense outlay of money, but if the three days' meeting last week is to be a criterion of future gatherings, the financial backers have excellent reason to chuckle to themselves and not feel discouraged as the result of last season's two meetings.

the unusual experience of Tom Kincaid, the National pilot, on Friday, the opening day of the meet. Kincaid won the 100 miles event for the Prest-O-Lite trophy, but the race had developed into such a kaleidoscopic whirligig long before the finish that Kincaid could not be made believe that he had annexed the stellar honors of the first day's program.

The big race was the feature of the afternoon and many new records for cars within the 301-450 cubic inches piston displace-

ment category were recorded as the result of the event. Seven drivers lined up for the start, as follows: Kincaid in the National, Lynch in a Jackson, Dawson in a Marmon, Harroun in a Marmon, Aitken in a National, and Fox at the wheel of a Pope-Hartford. Aitken set the pace for the first 19 miles, when Harroun went to the front and hung up new records for 20 and 30 miles. At this juncture Harroun had trouble and relinquished the lead to his teammate, Dawson, who slashed the records for 40, 50, 60, 70 and 80 miles. In the 85th mile, when he was leading by two laps, or five miles, Dawson was compelled to stop for a few minutes, and this slip-up sufficed to give the lead to Kincaid who was nosing along in second position like a bloodhound on the scent of a renegade. Kincaid stepped to the front and refused to be dislodged, hanging up a new record

JOHN AITKEN

for 90 and 100 miles, and winning the valuable trophy. When he was flagged and drew up alongside the pits Kincaid refused to believe that he had won the race, and it was some minutes before he could be convinced that the informants were not "stringing" him. When he learned that it actually was a fact, Kincaid hugged his mechanic in true Gaelic fashion.

The mile time trials which opened the meet were not spectacular, Bragg's Fiat scoring the fastest time, in 39½ seconds. Marmons, guided by Harroun and Dawson, ran one and two in the 10 miles for cars between 231 and 300 cubic inches, and Kincaid copped the 5 miles for cars in the 301-450 category, but was defeated by Aitken, his stable mate, in the race for larger machines. Greiner in a National won the 5 miles free-for-all and also nosed the way to the tape in the amateur race. The summaries:

One mile time trials—Lytle, American, 0:46.05; Kincaid, National, 0:46.55; Aitken, National, 0:43.3; Bragg, Fiat, 0:39.5; Har-

roun, Marmon, 0:41.05; Kerscher, Darracq, 0:43.4.

Five miles, 161-230 cubic inches—Won by Chevrolet, Buick; second, Endicott, Cole; third, Frayer, Firestone-Columbus. Time, 4:41.77.

Ten miles, 231-300 cubic inches—Won by Harroun, Marmon; second, Dawson, Marmon; third, Fox, Pope-Hartford. Time, 8:16.8.

Five miles, 301-450 cubic inches—Won by Kincaid, National; second, Dawson, Marmon; third, Harroun, Marmon. Time, 4:05.76.

One hundred miles for the Prest-O-Lite trophy, 301-450 cubic inches—Kincaid, National; second, Merz, National; third, Lynch, Jackson. Time, 1:23:43.12.

#### Second Day—May 28th.

With nearly twice as many spectators in the grandstand and bleachers as on Friday afternoon, Saturday's racing was auspicious. The 200 miles race for the Wheeler & Schebler \$10,000 trophy was the magnet for all the crack drivers; the ultimate capture of it by Ray Harroun and his Marmon

THOMAS KINCAID

practically justified his claim to honors as a non-stop performer. Harroun stopped only once in his long flight that dealt the record table a staggering blow, and that once was not because of mechanical trouble, but for the purpose of replenishing fuel.

There were several spectacular finishes and two accidents, and these were gingery enough to satisfy the spectators even if they were not heartily endorsed by the principals. One accident occurred in the 10 miles handicap and Herbert Lytle, whose numerous escapades have earned for him the doubtful honor of being regarded as the "hard luck driver," was the victim. Lytle's accident was as spectacular as it was unusual. Both rear tires blew out within 30 feet of each other and before he could shut off the power the car had swerved into the soft infield and upset. Lytle was sent to the emergency hospital with a broken left leg, while William Clifton, his helper, escaped with a sprained right shoulder.

The other accident occurred during the running of the famous Wheeler & Schebler trophy race. Dawson's car slipped a tire on the backstretch and skidded into the soft dirt inside the edge of the oval. After turning a complete somersault with Dawson still clinging to the wheel, the car stopped, with all the wheels stripped to the hubs. No more spectacular accident ever happened with so little consequence, Dawson not suffering so much as a scratch.

one of the remaining events. The summaries:

One mile time trials—Motsinger, Empire, 1:07.1; Lytle, American, 0:44.14; Aitken, National, 0:46.3; Bragg, Fiat, 0:41.3; Harroun, Marmon, 0:42.33; Kerscher, Darracq, 0:41.83.

Ten miles, 301-450 cubic inches—Won by Aitken, National; second, Harroun, Marmon; third, Merz, National. Time, 8:08.3.

Five miles, 451-600 cubic inches—Won by

second, Lynch, Jackson; third, Aitken, National. Time, 2:46:31.

Third Day—May 30th.

Six national championships and the 50 miles race for the Remy Brassard were the features of the closing afternoon's program to a most successful meeting. The two preceding days had been so successful that 60,000 people attended the final instalment, and they were not short-changed in excitement, either.

Ray Harroun is indeed a much-blessed man. He combines his fund of technical knowledge with a natural gift of fearless driving, and this dual capacity came in handy on Monday. Not only did Harroun ascend to the honor of one of the national championships, but he won the Remy Brassard, a continuation of the old bicycle idea, the terms of which gift stipulate that Harroun shall draw a weekly stipend of \$50 until some other driver wins the arm circlet from him. As the next meeting will not take place until July Harroun at least is assured of gasoline money until then.

In the six national championship events the honors were well distributed, so that everyone should feel satisfied. Harroun really was the hero of the day. Besides winning the Remy Brassard and one of the titles, he figured in an exciting episode that brought out his nerve in unmistakable manner. While warming up his engine preliminary to one of the events a front tire

"HURDLING" THE OBSTACLE IN THE OBSTACLE RACE

In the early part of the race Chevrolet, following his usual custom, began battling out the laps as though it were his last day on earth and he wished to roll up as many miles as possible in that time. The natural result was that he soon flunked and Burman, his teammate, after whirling some dizzy miles, kept him company in the repair pits. Harroun's consistency then became apparent, and he led at 10 miles, with Kincaid running a close second. After the 15th mile Harroun was never headed, while Dawson kept him company until he went through the fence, this occurring in the 61st mile. Lynch, the doughty Jackson man, then began to show his caliber, and ran into second place, which he maintained until the finish, not having stopped once. Aitken, National, finished third; he drove a stock "Forty" and not a National "Sixty" as was reported.

One of the interesting features of the meet was a 2½ miles hurdle race for Overland cars. This event raised the curtain to the meet. Two "board hills," at an angle of 45 degrees were placed on the track, and the cars had to climb over and descend these artificial bumps. Of the six drivers entered three had the nerve to take both hurdles, Myers finishing the two miles in 3:28.52, excellent time, considering the hazardous nature of the test. Bragg's Fiat made the best time in the mile trials, and Oldfield, Wilcox and Aitken each captured

HARROUN AND THE MARMON BEETLE IN FULL FLIGHT

Oldfield, Knox; second, Herr, National; third, Aitken, National. Time, 4:03.24.

Ten miles free-for-all handicap—Won by Wilcox, National; second, Lynch, Jackson; third, Clarke, Cutting. Time, 10:55.33.

Two and one-half miles hurdle race for Overland cars—Won by Myers, 3:28.52; second, McGee, 3:38; fourth, Gregg, 4:43.

Two hundred miles for Wheeler & Schebler trophy—Won by Harroun, Marmon;

worked off and Harroun was left to the mercy of uncertain traveling. He did not become flustered, but stuck to the car even though it rushed at the cement barrier at the backstretch, and tore out a four foot section of it. Following this episode Harroun went in the 50 miles grind and won the race. He is a man devoid of nerves. During the afternoon Harroun was called to the front and presented with the Wheeler

& Schebler trophy and the \$1,000 check which the trophy carried with it.

The first of the championship events run was the 10 miles for cars in the 161-230 cubic inches class and Chevrolet captured the title without any real contention. This was followed by the 5 miles championship for 231-300 machines, and Dawson and Harroun, both on Marmons, ran first and second. The third titular event was at 10 miles for cars of the same engine dimen-

mon; second, Harroun, Marmon; third, Anderson, Marion. Time, 4:41.3.

Five miles free-for-all—Won by Bragg, Fiat; second, Kerscher, Darracq; third, Aitken, National. Time, 3:34.70.

One kilometer against time—By Oldfield, Benz, 0:21.45.

Ten miles National Championship, 231-300 cubic inches—Won by Harroun, Marmon; second, Dawson, Marmon; third, Anderson, Marion. Time, :35.21.

second, Merz, National; third, Kincaid, National. Time, 7:50.75.

Ten miles National Championship, 301-450 cubic inches—Won by Aitken, National; second, Kincaid; National; third, Merz, National. Time, 7:51.71.

Ten miles free-for-all—Won by Bragg, Fiat; second, Kerscher, Darracq; third, Titten, National. Time, 7:02.6.

One mile against time—By Barney Oldfield, 0:35.6.

LINED UP FOR THE TROPHY RACE

THE START OF THE TROPHY RACE

sions, and it provided a close finish between Harroun and Dawson, the former proving victorious. Anderson set the pace until the last lap, when he was out-jockeyed in the spring for the finish.

Aitken and his consistent National car proved victorious in both the 5 and 10 miles championship races for cars with engines between 301 and 450 cubic inches. In both events Kincaid had the runner up position, while Merz was third twice. The 10 miles championship for cars between 451 and 600 cubic inches was won in clever fashion by Oldfield's Knox, which outran Merz and Kincaid in the final spurt. Caleb Bragg, the so-called amateur, inscribed his name in the books by winning two free-for-all races with his Fiat.

Nine cars started in the 50 miles Remy Brassard Grind and this event was the feature of the closing day. Harroun further endeared himself to the hearts of the "fans" by his consistent work in this race. He assumed the lead before the 30th mile and easily maintained his position until the finish, breaking the class record in so doing. Dawson, his stable mate, was second, and Fuller, in a Pope-Hartford, came in for third award. The summaries:

Ten miles free-for-all—Won by Bragg, Fiat; second, Kincaid, National; third, Aitken, National. Time, 7:21.95.

Ten miles National Championship, 161-230 cubic inches—Won by Chevrolet, Buick; second, Burman, Buick; third, Miller, Warren-Detroit. Time, 9:00.36.

Five Miles National Championship, 231-300 cubic inches—Won by Dawson, Mar-

mon; second, Harroun, Marmon; third, Kincaid, National; second, Merz, National. Time, 4:06.7.

HOWARD AND W. C. MARMON  
AND MANAGER RICE

Five miles free-for-all handicap—Won by Reed, Stoddard-Dayton; second, Harvey, National; third, Aitken, National. Time, 3:38.6.

Ten miles National Championship, 451-600 cubic inches—Won by Oldfield, Knox;

Fifty miles for Remy Grand Brassard, 231-300 cubic inches—Won by Harroun, Marmon; second, Dawson, Marmon; third, Fuller, Pope-Hartford. Time, 42:41.33.

#### Regal Plugger has a Close Call.

R. W. Dean and Lee Cuson, who are piloting the Regal Plugger on its 5,000 miles "around the circle" journey, had a narrow escape from drowning near St. Charles, Mo. While crossing a weakened bridge across the Missouri river, the structure collapsed and the car and its occupants were precipitated into the stream. The drop was not great but the water was deep and the men saved themselves only by swimming. Later the Regal car was raised by a derrick, which by great good fortune chanced to be at work near by, and the journey west was resumed early the next day.

#### Jackson Withdraws Suit for Trophy.

The Jackson Automobile Co., of Jackson, Mich., has withdrawn its suit against the Indianapolis Motor Speedway for possession of the Wheeler & Schebler trophy. The Speedway officials have inscribed on the cup the record of the Jackson's performance in the race for the trophy last August, when a Jackson, driven by Leigh Lynch, was comfortably in the lead at the end of 235 miles, when the race was stopped on account of the dangerous condition of the track, and the event declared "no race." When it was refused possession of the trophy, the Jackson company promptly instituted legal proceedings.

## EASY RUN TO RICHMOND AND BACK

Washingtonians Take a Four Days' Jaunt to Virginia Capital—Twenty Cars "Survive" the Trip.

Sprinkled with dust accumulated in 465 miles of travel over Virginia highways, 20 of the 21 contesting cars in the Washington "Post's" second annual endurance run to Richmond, Va., and return, which rolled out of the National Capital Friday morning, 27th ult., returned to it Tuesday afternoon, 31st ult.; eight of them had perfect scores.

That the contest was much in the nature of a pleasure jaunt may be gleaned from the number of survivors and from the fact that those who were penalized incurred their demerits for trivial causes.

The starters were as follows: G. A. Hardart, Elmore; Bert Robertson, Columbia; John Fister, Mora; H. L. Moedes, Oldsmobile; A. L. Drew, G. J. G.; Ted Johnston, Buick; Herbert M. Hall, Marion; W. D. Arrison, Washington; Frank Carter, Washington; H. E. Walls, Maxwell; E. H. Wine, Moline; Emory Knudson, Staver; Clayton Graff, Overland; Frank Hosner, Regal; J. C. Larcombe, Jr., Moon; E. J. Drake, Ford; Stanley Mortimer, Buick; C. E. Miller, Ford; E. Selby, Paige-Detroit; A. D. Rea, Maxwell; I. C. Hamilton, Hupmobile.

The cars which completed the run without penalization were as follows: Class C, Maxwell, Moline; Class D, two Washingtons; Class E, Oldsmobile. Each of the class winners will receive a silver cup and where there is a tie lots will be drawn by the drivers to determine the ownership of the cup. However, the losers at the drawing will receive some balm for their disappointment by having their names engraved on the trophies together with the names of the winners. All of the perfect score drivers will draw for the sweepstake cup which was offered as first prize.

Staunton, Va., was the stopover on the first day and the 165 miles over excellent roads for most of the way were made in good time, the cars starting from Washington at minute intervals after 7 a. m. Dinner was taken at Winchester, made famous by General Sheridan's ride. At Winchester one of the drivers was halted by a constable and ordered to the center of the town where the Mayor would be ready to try him for exceeding the speed limits. He did not keep the involuntary appointment, however, and nothing came of the matter.

In several places constables shouted warnings which went unheeded, and in many of the towns which were passed through on the first day a holiday was declared and spectators lined the streets and roads and cheered the motorists as they flew by, while at other points groups of

girls gathered on the corners and tossed roses into the cars as they passed. Despite a bad stretch of road in the early part of the day, which alone was responsible for most of the penalizations due to carburettor and brake adjustments, 10 of the cars reached the night control with clean bills of health. The sharp stones, however, in the roads caused considerable tire trouble. Eighteen cars checked in at the night control, the delinquents being the Ford, Regal and Elmore. The latter had trouble outside Staunton, which necessitated it being towed and it was disqualified. It continued as a non-contestant, however, and was scored as a survivor.

With good roads again the rule on the second day's run to Richmond, where the tourists laid over for a day, it was but natural that there would be few penalizations. Nine cars reached the Virginia capital with their score sheets unsullied in the two days running, but several others had large penalties charged against them for mechanical troubles. Although the tourists had permission to use their machines on Sunday during their stay in Richmond for sight-seeing purposes without incurring further penalties, few of the contesting cars were taken from the garages for the excellent reason that long before any of the tired motorists awoke Sunday morning squads of Richmond cars and their owners were parked outside the visitors' hotel waiting for the visitors to put in an appearance to be whisked off to points of interest.

Escorted by Richmond motorists, the last one of whom did not turn back until 36 miles from his home city, the Washingtonians bade adieu to their hospitable Southern brethren on Monday morning and got under way on the homeward leg of the trip. Monday being a holiday, thousands of townspeople greeted the motorists and cheered them as they flitted by. Excepting for a few stretches which recently had been worked, the roads were in good shape and the schedule easily was maintained by the cars. Still in Virginia territory, the last night away from home was spent in the little town of Orange, the cars being packed on the grounds of L. Custdale Academy.

The last day's run of 100 miles was made in fast time, and on reaching the outskirts of the national capital the cars were halted until all had reported, when they entered the city in procession. Bedecked with pennants and the contestants wearing farmers' straws and bandana handkerchiefs, the cars paraded down Pennsylvania avenue and then gathered at the rendezvous in front of the offices of the "Post," after which they were dismissed.

The surviving cars were the following: Hupmobile, Paige-Detroit, Ford, Overland, Maxwell, Oldsmobile, Buick, Ford, Buick, Washington, Marion, Washington, Moline, Mora, Columbia, Regal, Buick, G. J. G., Staver and Elmore.

## HUGHES SIGNS THE CALLAN BILL

New York State's New Automobile Law Becomes Effective in August—Its Principal Provisions.

The Callan automobile bill now is a law, Governor Hughes having affixed his signature to it on Tuesday last, 31st inst. The law, which will become effective August 1st next, was printed in full in last week's Motor World.

For the present system of permanent registration in New York, the law substitutes annual registration which must be renewed on the first day of August of each year. Fees are \$5 for 25 horsepower, or less; \$10 for more than 25 and less than 35 horsepower; \$15 for more than 35 and less than 50 horsepower; \$25 for more than 50 horsepower, A. L. A. M. ratings to govern. Vehicles to be used solely for commercial purposes, \$5. On applications for registration filed after January 1st of this year, a reduction of one-half of the fees will be allowed. Non-residents of only such states as exempt New Yorkers from the provisions of their laws, are exempted by the Callan measure.

Owners who may dispose of their cars must report sale to the secretary of state.

Manufacturers and dealers will pay \$15 a year for a general registration of all their cars, and \$1 additional for each registration plate affixed to such cars. Cars so marked shall not be operated for private use or for hire.

Cities of the first class—New York, Buffalo and Rochester—may fix their own speed regulations without stint, and while other cities and incorporated villages also are permitted to make such regulations, they cannot require a speed of less than 15 miles per hour; a greater speed over a distance of one-eighth of a mile will be, however, presumptive evidence of careless driving. Elsewhere the speed must be "careful and prudent," but "a rate in excess of 30 miles an hour for a distance of one-fourth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent." Cities and towns must erect signs showing where their speed limits begin and end.

The chauffeur's license fee is fixed at \$5 annually; his application must be accompanied by his photograph and must be sworn to before a notary public or justice of the peace. All chauffeurs must pass an examination and they may be restricted to the operation of a particular type of car; and no license will be issued to anyone under 18 years of age. The nature of the examination has not yet been determined, being discretionary with the state officers, but it is not likely to be very severe from the technical side.

**AMATEUR RUN CAUSES CLUB BREACH**

**Unpleasantness Between Crescents and Long Islands—Trouble Arises Over Entertainment Expenses.**

It is possible that the contest for the Pardington challenge trophy between teams representing the Long Island Automobile Club and the Crescent Athletic Club of Brooklyn, N. Y., which was decided last week, will prove the first one and the last one. For instead of promoting good feeling and amateurism, that free and easy endurance contest, which was won by the Long Island club, has provoked a breach between the two organizations which will not easily heal; and the dollar sign, which did not show itself during the contest itself, intruded itself unpleasantly immediately afterward; in fact, it is the cause of the trouble.

It appears that the Long Island club made the Crescent's team its guests at breakfast the morning the contest started and also garaged the Crescent cars the night before. It was the general understanding that the "athletes" would return the compliment at the end of the journey, and this idea was confirmed by President McDermott, of the C. A. C., in a speech he made at the Riverhead smoker. At the conclusion of the contest the entire party repaired to the Crescent's summer house at Bay Ridge, and while seated at the dining table information was conveyed to the Long Islanders that they would have the exquisite privilege of signing charge checks for the meal that they just had started to eat.

This created a buzz and so incensed President Alderman that with several others seated in his vicinity he arose and left the table. Later Henry Martin, chairman of the C. A. C. automobile committee, and A. R. Pardington, the donor of the trophy, who had competed as a member of the Crescent team, both of whom are members of both clubs, resigned from the Long Island organization and soon thereafter news of the affair became public. It has created a lot of ill feeling, and the end of it is not yet in sight.

**Bender Gets an Economy Award.**

Due to the perseverance of J. A. Bender, driver of the Knox car in the Chicago Motor Club's economy contest on the 19th ult., the results of which were detailed in last week's Motor World, in continuing in the test in the face of a discouraging siege of tire troubles, the standing of the contestants has been revised and Bender has been awarded second place in the standing and winner of the \$3,000-\$4,000 class. Weighing 4,255 pounds loaded the Knox consumed 1,561 ounces of gasoline for the

185 miles and averaged 15.6 miles per gallon. This performance gave it a percentage of 2.72 under the formula and ousted the Hudson with 2.42 from second place. Although finishing several hours after the judges had gone home, the rules permitted the deduction of time lost for tire trouble, and it was this provision which changed the complexion of the final standing. Another alteration is the disqualification of A. G. Shillo's Overland for failing to finish on schedule time, a broken spring causing part of the delay, and this elimination gave the much disturbed Hudson a final resting place in third position.

**Champagne for the Best Guessers.**

Probably because of the attractiveness of the numerous prizes offered, the second annual "sociability-guessability" run of the Washington (D. C.) Times to Great Falls, Md., and return—24 miles—on the 24th ult., attracted a record field of 99 starters. Vice-President James Sherman lent his services to help make the infantile contest a success and set the secret time of 119½ minutes as the official schedule for the distance. These figures were closely approached by the first prize winner, E. A. Garlock, Overland, who "guessed" at the unknown figures so closely that he overshot the mark by but 26 seconds. His reward was the silver cup offered by the Times, and in addition he received a magnum of champagne—an appropriate combination. Second award, two magnums of champagne, was captured by Christopher Dawson, Hupmobile, who was 41 seconds behind the schedule. Joseph Trew, Reo, accounted for third prize, a suitcase. Repeating her performance of last year, Miss Lillian Miller, Ford, again captured the first ladies' prize, a cut glass bowl. Her time varied 156 seconds from that in the sealed envelope. Most of the contestants finished, and nearly all received a prize.

**No Fee Due from Returning Tourists.**

Brokers who have been accustomed to exacting a charge of \$10 or \$15 for "clearing" American cars owned by returning tourists have had that source of easy money plugged up. The legality of the charge having been challenged, William Loeb, Jr., collector of the port of New York, has sustained the challenge and ruled that "wharf examination of American automobiles returned from abroad and foreign automobiles returned under certificate of registration is made of such automobiles when applied for by the importer providing no duties are collectable. Usual and ordinary repairs not including ten per centum of the original cost of the car are not considered dutiable. Extra equipment and accessories procured abroad are held to be subject to duty." A. L. Westgard's Touring Club of America claims credit for having secured the collector's ruling, having brought the matter to his attention.

**SYRACUSANS TRY RELAY GUESSING**

**Messages Are Relayed from Club to Club on a Secret Schedule—Amusements Are Provided en Route.**

Guessing in relays had its first trial on Saturday last, 28th ult., when an up-state New York paper conducted what it termed the first annual Central New York Relay Club run. Incidentally, the event introduced to public notice for the first time the Central New York Relay Club, said to be composed of members of the various local automobile clubs throughout the state. Certain messages from Syracuse business men and officials of the National and State automobile associations played an inconspicuous part in the event itself, having served a useful purpose in the advance work of the affair. The messages were relayed from club to club along the route, while as a sort of guard of honor to the messages, a dozen Syracuse cars with their occupants covered the entire distance of 400 miles or so.

The "secret" part of the program, which was supposed to add great zest to the business of carrying the business men's messages, consisted in the selection of unannounced running times between the various meal stations along the route. The car whose driver made the closest guess as to this schedule was promised a special prize, offered by the promoting publication. The route after leaving Syracuse included these clubhouse stops: Auburn, Ithaca, Elmira, Owego, Binghamton, Oneonta, Richfield Springs, Utica, Rome, Oneida and Syracuse. Luncheons, dinners, baseball games and sightseeing expeditions were important incidentals on the program which were participated in by the Syracuse contingent and by such of the local organizations as happened to be on hand.

Those participating in the run were Hubert S. H. Wilson, Fred A. Marshall, L. W. Quick, Frank Sprague, Harry Conde, Thos. Willis and George H. Messers. The remainder of the contingent included an official car, driven by J. Arthur Richie; a pilot car which carried Deputy Highway Commissioner Lyons beside Pilot Forman Wilkinson; two press cars, and a truck loaded with confetti. Although the contestants banqueted after their arrival in Syracuse on Tuesday evening, no announcement was made as to the identity of the "best guesser."

**Mont Cenis Pass Open to Motor Cars.**

The famous road over the Mont Cenis pass in the Savoy Alps has been opened to automobile traffic. As this road is the most important and most picturesque pass between France and Italy over the Alps, its opening is considered a great event.

**AMATEURS ON ANDERSON'S HILL**

**New Association Makes an Auspicious Beginning—Lambert and Rutherford Prove the Star Performers.**

Amateurism of the encouraging sort had its real beginning on Anderson's hill, at White Plains, N. Y., on Saturday last, 28th ult., when the recently formed Amateur Automobile Contest Association, composed

Plains and Harrison, and has an average grade of 6 per cent and a maximum slant of 11 per cent. Although having an excellent surface and but one curve, the course was difficult to negotiate, as it consists of a series of rises with a decline at the straightaway finish. Only members of the association were eligible to compete, and the policing and management of the function reflect credit on the promoters. There was not much for the police to do, however, as the hill is rather inaccessible to

to Lambert with a Mercedes. He was clocked in 1.04½. In this class the contestants were allowed one trial only, while in the other events two trials were permitted.

The only other driver to gather more than one prize was J. M. Rutherford, National, who corraled the 301-450-cubic inches class by a masterly drive in 1.05½. By his consistent performance in both trials, Rutherford also annexed the Jesup cup offered for the best average time in any class. C.

ONE OF THE AMATEURS AND SOME SPECTATORS

RUTHERFORD ON THE STIFFEST RISE

largely of the fashionable set of Westchester County, made its debut. While at first the new organization assumed a haughty attitude towards the American Automobile Association and intimated that it would do as it pleased without regard to the national body, it later experienced a change of heart and showed its allegiance by applying for a sanction and adopting

pedestrians and no great crowd gathered. The association had erected a stand at the finish point which was fairly well filled, chiefly by ladies.

The bright particular star of the day was G. B. Lambert with a big "90" Simplex, who was a favorite in the free-for-all class and who flashed up the grade in winning time, 1.03 flat. Although it was his only

H. Jackson, Buick, took second and H. A. Weatherbee, Speedwell, was third. Wishart first distinguished himself in the 451-600 division, which he won by the close margin of one-fifth of a second, making the trip in 1.05 flat. G. W. Quintard, Simplex, took second easily and J. D. Tooker, Stearns, captured third.

the A. A. A. contest rules for its events.

This innovation in motor climbs, free from trade influences and dollar signs, drew good fields and was productive of fast times and close competition over a course which tested the mettle of both drivers and machines. The course, which was a measured mile, was situated midway between White

appearance of the day, his time was the fastest and gave him a double victory, the Association Cup for his class and the Northrup Fowler trophy for the best time. Spencer Wishart, a youthful driver, who at his maiden appearance in the last Vanderbilt race made a creditable showing, gained further laurels by running second

cubic inches was an easy victory for Thomas Cooke at the wheel of a S. P. O., who romped up the incline in 1.16½ and had several seconds to spare. Second honors went to an E-M-F., driven by H. C. Sierck, who topped the hill in 1.23½, and C. M. Chauncey, Lancia, accounted for third. The curtain raiser was an event for

## THE MOTOR WORLD

motorcycle policemen, and evidently the courage oozed from most of the nominees, for but four of the thirteen entrants started. Officer Ruggiere mounted on an Indian was the winner, reaching the finish line in 1.07½. The results are given in the table:

For cars not exceeding 300 cubic inches.

Drivers and Cars.	Time.
Thomas N. Cooke, S.P.O.	1.16½
H. C. Sierck, E-M-F	1.23½
C. M. Chauncey, Lancia	1.24½
A. E. Gallatin, Lancia	1.25½
W. M. Quimby, Chalmers	1.29
J. Thompson, Premier	1.31½
A. W. Page, Chalmers	1.32
J. G. Wilson, Lancia	1.32

For cars between 301-450 cubic inches.

J. M. Rutherford, National	1.05½
C. H. Jackson, Buick	1.10

## SNAKE HILL CLIMB POOR SPORT

Bridgeport Event Suffers from Banker's Opposition—Scarcity of Entries—Oil too Liberally Applied.

Failing to have his application granted for an injunction to prevent the Bridgeport Automobile Dealers' Association from holding their hillclimb on Snake Hill, Fairfield, Conn., on May 30, Frederick Sturges, the wealthy banker of that town, had the satisfaction of knowing that his opposition resulted in a paucity of entries which practically drained the event of all semblance of a contest, and reduced it to

Elmer Knox in an Atlas was the only other competitor in this division.

J. W. Schenck steered a Pullman to victory in Class 4, his time being 1.34½, and Griffin, Stoddard-Dayton, took second. In the two other classes Taylor, Correja, and Brooks, Warren-Detroit, captured first honors in hollow fashion, the latter having a walkover. The course was a winding one and somewhat difficult to negotiate, but there were no accidents. It was patrolled by a detachment of militia, who handled the crowds with comparative ease. In connection with the automobile events two motorcycle classes were run. Both were won by Indian machines, G. A. Wildman capturing the single cylinder class in 1.26, and P. Cox the twin division in 1.13.

J. G. Wilson, Lancia	1.44½

## Fairmount Park Race Again Approved.

All uncertainty as to the staging of the Fairmount Park road race this year has been removed with the granting of permission by the Park Commission to the Quaker City Motor Club of Philadelphia to hold the race. In accordance with this official authorization, the club has named October 8 as the date for the third running of the classic. The distance will be 200 miles, as before.

a mere exhibition of a handful of cars. Just how much of a sporting farce the affair was may be judged from the fact that there were about a dozen entries for the ten events on the card.

Scheduled to start at 7.30 a. m., a most unearthly hour, and one which caused a long cavalcade of spectators to wend their way towards the hill shortly after daybreak, despite the heavy rain which was falling at that time, the contest did not get under way until nine o'clock. At that hour several thousand people were distributed along the course, the rain having stopped and the sun come out. An indication of the degree to which prospective entrants had been scared off by the legal complications, was illustrated by the scratching of the very first event for cars selling under \$850 owing to lack of entries.

Advance predictions that the course would be covered in 1 minute flat were not verified, the best time of the day being 1.08½, made by Billy Knipper in a Chalmers in the free-for-all class, which had the most entrants. Dean Rankin, in another Chalmers, was the runner up with a mark of 1.15, and Joe Taylor landed a Correja third. Rankin with the Chalmers also won his class event easily in 1.18, and

What was taken by local motorists as another method of venting his spite against them by Sturges, was the extravagant oiling of the roads in the vicinity of the hill a few days previous to the climb. It is said that so liberally was the fluid applied that the roads resembled the outpouring of a California gusher, and that driving was rendered doubly dangerous, while the clothing of many spectators who walked to the course was drenched with the oil thrown by the wheels of passing cars and practically ruined.

The results are given in the table.

## Class 2.

Drivers and Cars.	Time.
J. H. Brooks, Warren-Detroit	1.59

## Class 3.

Joseph Taylor, Correja	1.41
J. W. Schenck, Pullman	1.48½

## Class 4.

J. W. Schenck, Pullman	1.34½
Griffin, Stoddard-Dayton	2.06

## Class 5.

Dean Rankin, Chalmers	1.18
Elmer Knox, Atlas	1.39

## Class 6.

Billy Knipper, Chalmers	1.08½
Dean Rankin, Chalmers	1.15
Joseph Taylor, Correja	1.34½
McMullin, Buick	1.36

## FAVORS FORCE FEED LUBRICATION

English Expert Explains New Theory on Bearing Friction—Tests Show Advantages of Pressure System.

Although the average motorist probably is lacking in appreciation of the fact, it is unquestionably true that no small amount of credit is due the automobile engineer for the success achieved in the lubrication of the average engine. The whole subject of lubrication is one offering more perplexities than would seem possible at the outset, but when complicated by the peculiar conditions surrounding the operation of the motor vehicle it becomes exceedingly difficult of satisfactory solution. Incidentally, since the advent of the self-propelled vehicle, the science of lubrication has undergone more or less of a change, so that the modern gasoline engine embodies the latest practice in this, as in practically all other respects.

The most recent view of the matter is somewhat radically expressed by R. K. Morcom, a British engineer, who attributes the resistance which the well oiled bearing offers to motion to the force required to shear the minute film of lubricant which separates the journal from its bearing. Though at first this may seem rather a far-fetched theory, a moment's reflection will show that it is not without a basis of reason. In regard to it, Mr. Morcom makes this explanation:

"The old ideal of a co-efficient of friction gives place to the more suggestive theory that the resistance to motion is due to the shearing of a film of oil, which more or less completely prevents metallic contact and abrasion. The importance of the film is shown by considering that the resistance of a fully lubricated surface may be only 1 per cent. of a similarly loaded surface in which an oil film is not maintained. Resistance to shearing depends upon the viscosity of the lubricant, thickness of the film, and the area of film in shear. The temperature of the film may alter its viscosity; the extent of the film may not be equal to the extent of the bearing; the thickness of the film may not be such as to entirely prevent abrasion, and the clearance in the bearing may be irregularly distributed and inaccurate, and similar disturbances may be created by bad alignment of the shaft or its springiness, so it is not possible to entirely solve the problem. As usual in engineering, theory may direct or explain practice, but experience must determine it. Certain positive conclusions, however, may be taken as established:

"1. The resistance decreases with the thickness of the film.

"2. The resistance increases with the viscosity of the lubricant.

"3. The point of nearest approach is approximately 90 degrees from the line of load.

"4. The points of maximum and minimum oil film pressure are approximately at equal distances from the point of nearest approach.

"5. As the speed increases the points of maximum and minimum oil pressure get further and further apart, till at very great speeds they are in the line of load.

"6. As the speed increases the eccentricity of the oil film becomes less.

"7. The concentric position is the one of least resistance.

"8. Oil should be supplied at a point where the supply pressure is greater than the film pressure.

"9. The loading for a given speed must not exceed a certain limit at which the oil film is broken.

"10. The limit may be increased by lengthening the bearing, so increasing the cooling influence on the bearing.

"11. Oil grooves wrongly placed may destroy continuity of the film.

"12. A motion of pure rotation produces automatic maintenance of the film, provided the supply is adequate.

"13. The temperature varies throughout the bearing, the highest temperature being at the point where the film is thinnest.

"Further, in the case of a reciprocating load we know that—

"1. A reciprocating load, irrespective of rotation, produces automatic lubrication.

"2. Heavier mean loads can be supported if the direction of load is reversed, because the lubricant is more vigorously sucked in, and the retardation of surfaces approaching one another normally, increases very rapidly as the film becomes thinner.

"Generally speaking, failure of lubrication is caused by rupture of the film due to:—

"a. Inadequate supply of lubricant.

"b. Reduction of the viscosity arising from excessive heating, either general or local.

"c. Badly placed oil grooves.

"d. Overloading.

"e. Grit.

"f. Impurities, such as water, reducing the film-forming quality of the oil. . . .

"The more one studies the question the more does forced lubrication best appear to meet the requirements. Its acknowledged superiority over other systems for high-speed steam engines suggests its adoption for the motor car engine. Various splash and gravity systems have been very carefully designed and worked out for car motors, and the success is good enough. But practice in the long run always pronounces in favor of the theoretically best, and it is this which explains the increasing favor with which pressure supply meets.

"Some experiences with forced lubrication do not at once fit in with theory, and it may be of interest to describe a few observations and experiments.

"One of the most obvious things to examine was the actual saving in friction, if any, which occurred with forced lubrication. A trial was made on a 120 b.h.p. engine at 450 revolutions per minute. The engine was run unloaded with oil pressure of 30 pounds and 5 pounds, and without pressure, the supply being maintained with a syringe. A large number of no-load cards were taken and the i.h.p. averaged out. The results of the trial showed:—1. That the engine was quieter the higher the pressure. 2. The friction i.h.p. averaged 2.13, 2.41, 3.33, with 30, 5, 0 pounds pressure, respectively.

"There is some trouble in explaining the result, for one would expect the cooler oil and more complete oil film with the higher pressure to increase rather than decrease the resistance. Some light is thrown on the case by the quietening action, which means that the film thickness in reciprocating bearings was better maintained. In addition, such a result may occur in a steadily loaded bearing, owing to the more copious supply preventing excessive local heating of the film, leading to rupture. This is borne out by the experience that an engine with forced lubrication takes longer to 'run in' than one with splash or gravity supply, and, further, that its bearings take longer to take up a high polish.

"The chief points in favor of forced lubrication brought out by the trials were its more rapid adaptability to various conditions, its very positive maintenance of the all-important oil-film, and the simplicity of the provisions necessary to ensure perfect lubrication. With splash and gravity systems elaborate oil grooves, troughs and oil-ways are required, and often they are cut without due regard to theoretical considerations. With forced lubrication very simple oil grooves are satisfactory. All that is necessary is to provide a circumferential groove whereby a supply of oil is ensured at whatever point the minimum film pressure exists; the oil at this point will be forced right along the bearing, ensuring a perfect supply. Where more circulation is required, one or more horizontal grooves may be cut in the bearing at suitable points, forming practically an oil pad, and also by increasing the circulation, having an important cooling effect on the bearing. Circumferential oil grooves should not form a continuous band, but should be staggered, thus preventing the formation of a ridge on the journal due to lapping action.

"From various experiments it has been shown that bearings with forced lubrication will carry greater loads per square inch than others (this is largely due to the cooling effect of the copious supply and the certainty of its distribution), and it is interesting to consider the forces acting upon bearings in a motor car engine and those existing in a stationary engine of larger size. The short period of reversal is noticeable in the petrol engine diagrams.

"The extent to which forced lubrication

is applied varies with different makers. Some apply it to main bearings only, and others to main bearings and crank-pins; others carry it to the gudgeon-pin, and in some cases it is also carried outside to details of the transmission. There seems little reason, if a pressure pump is included in the design, not to apply the pressure at any rate throughout the engine. . . .

"Generally, in designing a forced lubrication system, the following points must be kept in mind:—

"Have a pump of ample size, with good big suction and delivery pipes. There is a tendency to fit pumps and pipes too small to realize the benefits of forced lubrication. The discharge from the clearance spaces is quite appreciable, and too small pipes or pump may lead to the ends of the system being starved.

"Another point which makes it necessary to have an ample pump is that, due to centrifugal and inertia effects on the oil in the moving parts, variations in pressure occur beyond those due to fluid friction and escape at clearances.

"Oil pumps of various types are used, the most common being: 1. Plunger pump; 2. Gear pump; 3. Vane pump.

"The first is the most positive, and probably the most generally efficient. The second is good, and lends itself to simplicity of design. The third does not appear to be any good for high pressure. Centrifugal pumps are generally unsuitable, especially with thick oil. The horsepower is quite small, so that the question of drive is an easy one, and there should be no difficulty in designing an absolutely reliable, well-protected, efficient drive for the pump. Some of the various drives used are mentioned in the table.

"The filter which must be fitted in the system should be efficient and accessible. It would be an advantage to place it in such a position that by lifting a cover it could be at once got at and periodically changed. The spare filter could then be cleaned ready for the next change over. The filter should have ample area, as the suction of the pump must be quite free. A point to be remembered which is often overlooked is that perforated zinc and copper are not good neighbors in an oil well where water may be present. The oil pipes and oil ways should be ample in area, free from sharp bends and corners, and of adequate strength to stand the highest pressure that may fall upon them. Steel pipes made to template are better than copper pipes, since the latter have been found to develop mysterious fractures. Where it is possible, hollow shafts and rods should be used to facilitate the distribution. All oil pipes should be carried in positions where they will not get in the way of overhauling and will be protected from risk of damage. It is a good thing to bring the pipes up on the under side of the bearings in motor car engines,

since they can be carried close to the cross-frames which usually support the bearings. In fact, the oil ways may actually be drilled in the crank-base casting. The edges of oil holes in parts subject to stress should be carefully rounded, or they may be origins of surface cracks leading to ultimate fracture.

"In testing the pumps some trials were taken on heavy oils to show the effect of congelation in cold weather. Owing to the small quantity which can pass, a heavy pressure may come on the delivery pipe and gauge, if fitted. This is one reason for fitting strong pipes. A hand or automatic by-pass may be fitted to relieve the pressure. A by-pass valve alongside the gauge opening into the make-up oil tank was used with success in one instance. The best place for an automatic relief valve is on the delivery pipe close to the pump. Such valves are, however, a source of trouble, and should be avoided; as a rule, a gauge can be obtained to stand far greater pressure than will be put upon it in this way, and still be sensitive at the normal pressure.

"A very short time is required to warm up the oil, and the trouble from this source is probably less with forced lubrication than with any other system.

"The chief wear in the bearings on a high-speed engine occurs at starting and stopping. A pump very quickly forces oil into a bearing, probably more quickly than the oil will get there in other systems. A non-return valve on the delivery pipe is possibly of value to ensure the system remaining full. The chief argument in favor of a pressure reservoir supplying oil is based on the need for oil at starting, and such a fitting for the pump to discharge into might be of value.

"Any system in which a charge of oil is used for long periods may suffer from contamination of the oil. An experiment was made on a car fitted with forced lubrication. The sump was filled with a pure mineral oil, and the car run for 3,000 miles in about four months on and off. The make-up was by a small scoop pump feeding the proper quantity into the crank-case in the usual way. The oil after use was black in color and smelled of petrol. Its flash point, open test, was 214 degrees Fahr. against 435 degrees Fahr. On distillation at 300 degrees Fahr., 1½ per cent. of petrol came over. After distillation the flash point was normal at 435 degrees Fahr. The oil was still dark in color, but appeared to be a satisfactory lubricant. On burning, the amount of ash was very little over normal."

#### Proposes Motor Parking Spaces.

Hutchinson, Kan., rises to distinction by reason of its declared intention of establishing automobile parking spaces on its side streets. These parking spaces, it is explained, will be drives laid between the sidewalk and the curb, with runways lead-

ing up from the street line, in which motorists may stand their machines without obstructing traffic. Incidentally, Hutchinson's automobile tax of \$2 per machine hereafter will be collected annually instead of upon the enrollment of permanent registrations. The extra funds thus derived will be used for the construction and maintenance of the parking spaces.

#### Uses for Carbonic Acid Gas.

Although the use of carbonic acid gas for the purpose of tire inflation is not heartily recommended by most tire men, the fact remains that it possesses one or two very strong advantages for that service. One advantage is that in liquid form it can be transported in very small compass. Another, and by far the most important, is that in an emergency it is useful as a fire-extinguishing medium. Indeed, for this purpose alone it almost would pay to carry a small tank of the gas on the car at all times.

#### Tire Chains for Towing Purposes.

While the requirement for a tow seldom arises at a time when a length of rope is absolutely unobtainable, still it is well to bear in mind that on such occasions it is perfectly possible to make use of a pair of non-skid chains, fastened end to end for the purpose. At such times, of course, it is important to see to it that the axles of the towed and towing cars are well protected against the chafing of the chains.

#### About Altering the Carburetter Setting.

Generally speaking, it is a mistake to attempt to adjust an engine which is running irregularly by altering the setting of the carburetter. While it is possible to do this sometimes, merely by feeding an excessively rich mixture to the cylinders, the result is not a cure for the trouble, though it may remove the symptom for the time being. The real difficulty generally is to be found in the ignition system, or if not there, in the setting of the valves.

#### Bicycle Lamps to Meet Law's Demands

For city use, when the standard dash lamps happen to be ineffective for one reason or another, it sometimes is possible to make good use of bicycle headlights. Such lamps, which not only satisfy the provisions of "no-glare" ordinances but afford good illumination, are light enough to be clamped to the front cross bar which acts as a stay for the headlights, thus requiring no special fitting or attachment.

#### Missourians Are "Shown" a Motor Line.

The first interurban automobile line to be established in Louisiana County, Missouri, was inaugurated May 14th. The motor cars began running on that day from Ashley to Louisiana, Mo. a distance of twenty miles.

## JUMBO TRUCK TO HAUL GIRDERS

Chicago Contractor Builds Big Car to Carry Structural Iron—Motive Power Supplied by Steam Engine.

One of the most instructive phases of commercial vehicle development is that in which it is applied to specific purposes so far different from standard requirements as to demand treatment which is in every way extraordinary. A case in point is the mammoth truck built by George W. Jackson, Inc., a prominent engineering and contract-

ard type of girder handling truck, is shown in the accompanying illustration. It is driven by a 60 horsepower steam plant, which is located in the low cab mounted over the frame just above the rear wheels. Steering is accomplished by means of the large hand wheel and chain connections to the swiveled front axle, while for handling the load, which may be so long as to require the use of a "Devil," or trailer truck behind, two long-lever capstans are provided on the huge double beam frame which forms the true "chassis" of the machine.

The main sills are of 10 by 12 inch Douglas fir, 32 feet long, heavily reinforced and standing 6 feet 8 inches above the ground.

shaft, which carries a bevel gear compensating mechanism. From the outer ends of the differential shafts, the final drive is taken to the rear wheels by means of 9 inch pinions, 4 inches wide, which mesh directly with internal gears riveted to the inner rims of the wheels. Sufficient clearance and a backlash is provided between pinions and internal gears to permit the driving wheels to be operated at different levels without binding the transmission. Sufficient allowance is made for one wheel to be as much as a foot lower than the other, as when running through deep ruts. In addition to this, a differential locking device is provided.

JUMBO STEAM TRUCK FOR HAULING STRUCTURAL IRON

ing firm of Chicago, for use in transporting structural iron. The class of truck which alone is thought to be suitable for this class of work is a familiar sight in all localities where modern construction work is in progress. The large wheels, high frame and arched axles, under which the load is suspended, are made necessary by the desirability of reducing the handling incident to transportation to the lowest possible minimum. Ordinarily either four or six horses are required to handle normal loads, and under such circumstances maneuvering in city traffic becomes a work of functions the successful accomplishment of which is a marvel to the beholder.

So far as is known, the Jackson firm is the first to apply mechanical propulsion to work of this character. The resulting vehicle, which is a modification of the stand-

The forward ends are supported on a heavy bolster which rests upon the fifth wheel which, in turn, is carried by the axle. The front wheels are 4 feet 6 inches in diameter with 12 inch face. The rear axle, which also carries a heavy bolster, is deeply arched. The rear wheels are 6 feet 8 inches in diameter, 18 inches wide, and shod with  $\frac{3}{4}$  inch steel tires.

The power plant consists of a two-cylinder, reversing engine, with 8 by 8 inches cylinder dimensions, making 225 revolutions per minute. Steam is supplied by a marine type water tube boiler 5 feet long, 5 feet wide and 4 feet 8 inches high, which has 325 square feet of heating surface and 13 square feet of grate area. A bronze pinion, 10 inches in diameter by 5 inches in width drives from the crank shaft to a  $37\frac{1}{2}$  inch gear on the 37-16 inch differential

The total weight of the truck is 12 tons, and its carrying capacity 20 tons. Its average speed is somewhere about  $1\frac{1}{2}$  miles an hour, and it is designed to transport structural members up to 60 feet in length, or even longer when the "Devil" trailing truck is used. The total length of the vehicle is 32 feet, its wheel base being 26 feet 6 inches. Its total height is 6 feet 10 inches and its width over all is 8 feet 6 inches. The entire mechanism was designed and built by the manufacturing department of George W. Jackson, Inc., and is said to have proved satisfactory in every respect, being particularly effective in respect to ease of handling under embarrassing traffic conditions and where, under normal conditions, the use of horses would render manipulation of such a huge vehicle almost impossible.

## MAKING TRUCKS IN WISCONSIN

**Former Chicago Company Begins Operations in New Location—Features of the Truck and a Test of It.**

Having completed the removal of its plant from Chicago to Janesville, Wis., the Monitor Automobile Works is well launched in the production of its commercial vehicles, under the direct supervision of C. D. Manley, assistant general manager, who formerly was concerned in the production of Reo and Oldsmobile cars. The Monitor is adapted to rather a wide variety of utility purposes, the single chassis foundation

Its grade is rated at 20 per cent. and its location and cobble stone paving prevent any "jugglery" in making it with a run. At the time the photograph was taken, the car carried a load of 1,600 pounds of spring water, with which it not only negotiated the grade successfully, but performed a sufficient number of evolutions to prove its absolute capability of taking care of itself under any reasonable conditions of service. With its load, the car was stopped half way up the hill, restarted and driven to the top, and afterward run to the bottom and backed up, with an intermediate stop and start.

### Rubber Blocks Violate New Jersey Law.

Rubber block tires, such as are being employed on commercial vehicles, are under

TWO-CYLINDER 20 HORSE POWER MONITOR DELIVERY WAGON

known as type "A" being built entirely independent of the body and hence being suitable for any type of upper works which may be desired by the user.

The rated power output is 20 horsepower, the cylinders of the horizontal opposed motor measuring 5 inches bore by 4 inches stroke. It is mounted under the forward end of the car in an accessible location, with magneto ignition equipment and a specially designed form of automatic lubricator which is mounted directly over the crank case. Transmission is by propeller shaft to the semi-floating rear axle, which is mounted on roller bearings. Changes of driving speed are obtained by means of a planetary gear-set affording two forward drives and one reverse. The total weight of the chassis is set down at 2,200 pounds. The rated carrying capacity is from 1,500 to 2,000 pounds. Solid tires are employed, both front and rear, the front equipment being 33 by 2½, while the rear is 34 by 3 inches.

The accompanying illustration shows the model "A 109" car, which has an open express body, in the act of climbing the 9th street hill in Kansas City, which is the supreme hill-climbing test of that locality.

the ban of the New Jersey law, according to a decision in the police court of Passaic, when a driver for the Hackett Motor Car Co. was fined \$25 for operating a machine with rubber blocks on the circumference of its wheels, in alleged violation of Chapter 224, Section 6, of the state laws of 1910. A state inspector of motor vehicles, Edward Thomas Moore, appeared as the prosecutor. The Consolidated Rubber Tire Co., the manufacturer of the rubber block tire with which the machine was equipped, has indicated its intention of taking the case to the Supreme Court and testing the legality of the law.

### To "Keep Tabs" on Delinquents.

Practical steps are being taken by the Motor Accessories Association, of St. Louis, Mo., toward protecting its members against those purchasers of supplies and accessories who do not pay their bills. Having elected officers for the coming year and arranged its working organization, the association is establishing a credit bureau, where information may be obtained as to undesirable customers who in the past have defrauded St. Louis dealers.

## SUBSIDIZING THE COMMERCIAL

**French Government Follows Example of its Neighbors—How the Money Will be Apportioned to Owners.**

Following the example of the German and Austrian governments in establishing a volunteer department in the train service of the regular army, to be used in war time, the French government just has voted the sum of \$60,000 to be devoted during the fiscal year 1910 towards the subsidizing of commercial motor vehicles in the hands of private owners. On purchasing, the owners themselves are obliged to make application for the subsidy, which will be immediately granted, providing conditions have been complied with, until the funds allowed for this purpose have been exhausted.

As an example of the assistance given, the purchaser of an approved truck carrying a minimum useful load of two tons will receive from the government \$400 on taking delivery of his vehicle, and \$200 for each of the three following years, providing, of course, that the vehicle is presented for inspection annually, and is maintained in proper working condition. For each addition of 550 pounds to the minimum load of two tons, an additional subsidy of \$30 on purchase and \$10 per annum will be allowed.

In return for this subsidy the owner must surrender the vehicle to the government in case of mobilization, which, in itself, is no hardship, as the vehicles doubtlessly would be immobilized by the calling out of their drivers for compulsory service. In France commercial vehicles and the army are so closely connected that it has been a common practice in the maneuvers of the past three or four years for manufacturers' test vehicles to be driven by the firm's own mechanics while the latter were undergoing their compulsory period of military training. The men pursue their normal calling with only a change from overalls to military uniforms, and the manufacturers have the satisfaction of knowing that their vehicles are in the hands of skilled men instead of being abused by the first comer picked from the ranks. During the annual maneuvers such vehicles will be hired from the owners at reasonable rates.

### Mitchell Builds a Testing Track.

With the purpose of removing its testers from the streets of Racine, Wis., and from the surrounding country roads, the Mitchell-Lewis Motor Co. has constructed a half mile testing track on its factory property. The track, which is of cinders, is provided with grades and other variations, which will give the cars as hard a test as on the outside roads.

## HILL CLIMBING ON THE HIGH GEAR

Enormous Stresses to Which it Subjects the Car and the Damage it Does—  
Figures Showing Losses.

Next to excessive use of the brakes, causing the car to skid and tear the shoes of the tires, about the worst thing a driver can do is to abuse the high gear. Those manufacturers who shout of the ability of their cars to negotiate any hill "on the high" are to blame for no little damage that results.

To climb a hill on high speed imposes the hardest kind of work, not only upon the engine but upon every other part of the car. And such stunts are unnecessary, for the lower gear ratios are provided for just this kind of work—the climbing of steep hills—and they should be used for it. The speed with which a car shoots up a hill is not by any means a criterion of the power and excellence of the car, but more often than not merely an example of the foolishness of the driver who, for the sake of a few seconds gained over "the other fellow," ruins his car to such an extent that it will render him much poorer service thereafter.

"It may be well," says the Co-Operator in dealing with the subject, "to consider a little more carefully the amount of work performed by an automobile climbing a gradient on, say, a gear ratio of three to one. A ratio of three to one means that one revolution of the driving wheels is produced by three revolutions of the engine crank-shaft. With the lower gear ratios, the intermediate and the low, the number of engine revolutions becomes still greater, as compared to the number of driving-wheel revolutions.

"With the engine running at high speed the pulling effort is slower, but of greater power, and it is also produced with greater evenness.

"It is not difficult to compute with exactness the distance which a car is propelled by one explosion of the engine, and the power consumed in hill-climbing. The circumference of a 34-inch wheel is, approximately, 106¾ inches, and in covering one mile the wheels revolve 593 times. Since the motor turns over three times as fast as the driving wheels it will require 1,779 revolutions of the crank-shaft to propel the car one mile. Thus if the Maxwell Model E should proceed at the rate of 30 miles per hour, approximately 889½ engine revolutions per minute are required. With two power strokes at each revolution there are 1,779 explosions a minute, or 3,558 explosions per mile, and each explosion propels the car about 1 foot 5¾ inches.

"The estimate presumes that the car is propelled over level ground. To mount

a hill means simply that grade resistance is added to the various frictional and other resistances. An automobile weighing 2,000 pounds climbing a hill 200 feet high (measured vertically) simply performs the task of overcoming the action of gravity, or lifting, and the calculation of the power required to do this must involve the factors from which the horsepower unit is derived. To lift 2,000 pounds 200 feet high in one minute is the same thing as lifting  $2,000 \times 200 = 400,000$  pounds one foot high in one minute. Theoretically, then, the lifting of 2,000 pounds 200 feet high requires  $400,000 \div 33,000 = 12.12$  horsepower, and the losses through friction, air resistance, etc., consume the remainder of the theoretical horsepower output.

"From the foregoing it must become apparent that rushing up a steep hill on the high gear must subject any car to enormous stresses, which are likely to affect the life and service to a considerable extent. Gear-shifting is not a cumbersome task, and the mounting of gradients will not be attended by harm if the gears are put to the use for which they were intended."

### Bold Methods of Tire Thieves.

Somewhat mysterious are the facts in a larceny case which at present is under investigation by the Philadelphia police department. Harry Cohen, a fourteen-year-old boy of Thirteenth and South streets, was arrested for the theft of an automobile tire belonging to J. W. Nock, of 1902 Green street. He is said to have confessed the theft and implicated Clarence Frick, a chauffeur. Nock's automobile was standing in front of the Forrest Theater; the car in which Frick was driving stood on the opposite side of the street. According to his "confession," Cohen removed the spare tire from Nock's car and carried it across the street, dropping it in Frick's car and making his escape by running down a near-by alley. Frick's automobile immediately started down the street, and also vanished. The police now claim that Frick and the boy worked in unison, and together managed to get away with a number of extra tires and spare wheels. Frick, when arrested, denied any knowledge of the matter, and although no direct evidence could be obtained against him he was held in \$400 bail.

### Where Fire Engines Cannot go Fast.

Because he exceeded the speed limit in driving an automobile chemical fire engine to answer an alarm, Raoul M. Collins, a Summit (N. J.) automobile dealer, was fined \$10 by Police Justice Hicks. Five witnesses testified that in addition to going at a high rate of speed, the vehicle had been guided through a crowded street without the horn being sounded by way of warning. Collins had been acting as emergency driver pending the appointment of a regular chauffeur from the fire department.

## MUST WAIT UNTIL PAINT IS DRY

Owner Who Took his Freshly Painted Car  
Learns a Legal Lesson—Responsible  
for Unsatisfactory Result.

Painting jobs sometimes may result in lawsuits if the customer be permitted to take his car out too soon after the painting work is completed, the proof being provided in the case of R. B. Shaw, proprietor of an automobile painting shop in Decatur, Ill., against Elkin Chandler, whose car was the cause of the trouble. The litigation came before Justice McCoy in that city, and resulted in a victory for the automobile painting man, although at the same time teaching him not to let customers have their machines before it is safe to do so.

The owner, Chandler, brought two cars to Shaw's shop for painting. As soon as the first machine was completed, Chandler took it out and gave it a hard drive over muddy roads. The mud was allowed to dry on the fresh paint, and the next day, when the car was washed, part of the paint peeled off. When the other car was finished, Chandler went to get it, offering payment for the work on it but refusing to pay for the first car, it is alleged, on the ground that the work was unsatisfactory.

Shaw refused delivery of the second machine until the entire bill of \$52.50 was paid. Chandler went to the circuit court and obtained a writ of replevin, with which he secured the car. In Shaw's suit to recover the debt, a number of expert automobile painters testified, with the result that Justice McCoy was persuaded that Chandler was at fault in running his car before the paint had dried thoroughly, and accordingly gave judgment in Shaw's favor.

### Pledged to Use Speedometers.

Outagamie county (Wis.) motorists who are members of the Outagamie County Autoist's Association, have pledged themselves to equip their machines with speedometers. At a recent meeting of the association, at which the speedometer equipment resolution was passed, it was voted that at no time and under no circumstances should any member violate the speed law. The use of speed indicating instruments was considered essential in order to enable the members to keep within legal limits. The meeting, which was held at Appleton, also took action looking toward enforcement of the law in regard to the posting of signboards by local authorities.

### Demonstrator Meets Tragic Death.

Walter J. Gould, of the Grout Automobile Co., Orange, Mass., was killed on the 24th in a collision of his machine with a stone wall. He was demonstrating the car to a purchaser at the time.

## SEEKING RUBBER SUBSTITUTES

Some of the Things the Search so far Has Developed—Efforts to Make Rubber Synthetically.

Considering that, by all the rules of precedent, this should be open season for the rubber substitute game, there is surprisingly little visible activity among the ranks of those who in the course of many years have kindly permitted their nearest and dearest friends to assist in the foundation of the magnificent industrial structures which they were about to rear. Likewise, it is to be noted that the long-continued high price of the genuine article has not had the to-be-expected stimulative effect on those who earnestly and seriously seek to produce in one way or another substitutes equivalent in their properties to the india rubber of commerce.

Possibly, in the case of Great Britain, always an easy prey to concerted speculative pressure, it may be that the apparent quiescence of the rubber substitutionists is explained by the activities of their brethren who are interested in the marketing of shares in more or less hopeful ventures in rubber plantation. But elsewhere the non-appearance of a crop of the good, old-fashioned synthetical rubber or new-process substitute projects, during the past winter must remain more or less an inexplicable mystery.

Originally as legitimate as the search for the Elixir of Life, the quest for the rubber substitute began in an earnest endeavor to discover some substance equally cheap or cheaper to secure and work than caoutchouc. Resulting from this effort, gutta percha, Balata and other natural gums have been introduced into the arts with great success; and it is but natural that the search should continue as still other natural juices present themselves for examination. Scientific research should not be confounded with the original dyed-in-the-wool rubber substitute promotion enterprise, which flourishes much in the same manner as do schemes for the distribution of the gilded brick and the phony green-back.

Beyond the realm of the irresponsible promoter, the rubber substitute proposition resolves itself into a blend of pure science and commercialism. Rubber experts pretty generally agree that there is little likelihood that a genuine substitute ever will be produced equal in all its properties to the true rubber, which is so essential in automobile tire manufacture among other things. Of the great number of kindred substances which are available and which are likely to increase in number as time goes on, the problem is not one of absolute substitution, but of skilful blending to

meet the demands of specific requirements. In a sense, rubber substitutes are not only possible but actually in use at the present time; they are not the substitutes in which the guileless citizen is invited to invest, however.

Summarizing the present state of artificial rubber, *Nature*, the London publication, prints an instructive article in which three classes of substitutes are recognized, namely, compounds containing no rubber whatever; composites, in which some rubber is employed; and the true synthetic rubber of the chemical laboratory. The first of these classes is the most important, commercially speaking, at the present time. Says the authority in question:

"Scores of recipes, including very diverse ingredients; but the basis of most is a modified oil. . . . If we test the drying properties of boiled linseed oil by spreading a little of it over a slip of glass and allowing it to dry, a film of oxidized oil is eventually obtained, having a certain modicum of toughness and elasticity. The liquid oil has taken up oxygen and thereby become converted into a more or less elastic solid. Tung-oil substitute is essentially such an oxidized product, manufactured by heating the raw oil until it has absorbed enough oxygen to cause it to thicken and become solid on cooling, when it is powdered and worked up with a little petroleum. . . .

"In a somewhat similar way the oils can be made to take up sulphur, becoming thereby solid and endowed in some degree with elastic properties. The treatment is analogous to the 'vulcanization' of rubber. . . . Colza oil is largely used for these purposes, but various others are available—linseed, maize, arachis, and castor oils, for example. . . .

"'Nitrated' oils are also used as the basis of some rubber surrogates. Thus one well-known product is a solution of a nitro-cellulose in linseed or castor oil which has been nitrated by treatment with a mixture of nitric and sulfuric acids. Other such articles are made by oxidizing the nitrated oil with lead peroxid or by simply heating it in air."

Another class of substitutes, it appears, is formed by adding to the oil such other ingredients as tar, pitch and creosote. Covering only a few of these, it is explained that "Russian" substitute, particularly applicable for the insulation of telegraph cables, contains wood tar, hemp and linseed oils, ozokerite, spermaceti and sulphur. "Oxolin" has a basis of fibrous material, such as jute or hemp. "Jones's" substitute is made from various gums and dispenses largely with the oils. Gelatin or glue is dissolved in creosote and then treated with some reagent, such as tannic acid, in the substance known as "Perkins's" substitute. "Bakelite" is produced by the condensation of formaldehyde and phenol, while by the compression of grape skins, it has been proposed to make a "grape-rubber." The

latter substitute, however, is frankly stated not to be a commercial product. With regard to these and other so-called substitutes, the authority continues:

"Some persons are disposed to deny them any right to the title, and would look upon them as mere adulterants whenever used partially to replace rubber in what would otherwise be an all-rubber article. Others admit, though sometimes grudgingly, that there is a place which such substitutes can usefully fill. Much depends on what the article is sold as, and on what it is to be put to. Not all the special qualities of rubber are wanted in all the products for which it is employed. A door-mat is one thing, a bicycle tire quite another. Where a high degree of elasticity is not really needed, as, for instance, in water-proof goods and electrical insulating work, there is a legitimate field for substitutes which may serve the required purpose. . . .

"It may be said at once that no substitute is equal to rubber in every respect. Chemically, the latter is a very inert substance—much more so than the substitutes. Hence, even if the latter were not otherwise inferior, they would be less durable than rubber under certain conditions. They are nearly all acted upon more or less readily in circumstances where rubber remains unharmed. The modified oils, in fact, are still oils in the sense that they remain glycerids, decomposable by alkalies, as also by steam under pressure. If used for articles exposed to these agencies, they fail in durability, whatever their excellencies otherwise. . . ."

With regard to the synthetical variety of rubber, the original "will-o-the-wisp," there are "turpentine-rubber," which is made by passing turpentine through a hot tube and treating the resulting vapors with hydrochloric acid; and the product resulting from Heinemann's patent, "which attempts a true synthesis, starting with mixed acetylene and ethylene gases and ending in a substance closely resembling caoutchouc, if not identical with it."

A bit of timely interest is lent to the subject through the publication in the United States Consular Reports within a few days, of announcements concerning the discovery of yet another synthetic rubber process by a German professor at Kiel. The report which, in roundabout fashion, reflects the excitement created in Birmingham, England, by the news, states that "the invention is based on the boiling together, under certain conditions, of 'isoprem' with acetic acid, in a closed tube, the result being the creation of a grey composite possessing all the properties of pure rubber and capable of being vulcanized in the same manner as gutta-percha." Unfortunately "isoprem" is a substance not recognized by the dictionary, so that the public, for the time being, must remain somewhat in doubt as to the true classification of the new process.

While disposed to remain of open mind in the matter, the writer of the article quoted above harbors no boundless enthusiasm over the prospect of the elimination of the rubber plantations of the Amazon district; nor does he offer much encouragement to those who are tempted to invest in projects to that end. "Will rubber plantations go the way of madder-fields and indigo cultivation?" he answers, "Well, the future is on the knees of the gods. In the face of the precedents just mentioned, to say nothing of others, he would be a bold man who would venture to say that even the best quality of rubber may not some day be made on a commercial scale from cheaper materials such as beet-sugar and calcium carbide. But the day is not yet." ". . . One of the first doubts to arise is whether the synthesized caoutchouc will have the physical properties of natural rubber; or whether these, by any course of treatment, can be imparted to it. This doubt resolved, there comes the question of economical production in competition with the natural product. Much time and thought have been spent on the problem of synthetic rubber, and it is safe to conclude that there will yet be many a headache before it is solved. Judging by what is known to have been done rather than by the promises, owners of rubber plantations may for the present sleep peacefully in their beds."

#### Electric Lights Preserve Batteries.

One advantage which has come in connection with the adoption of electric lights in automobile service is that it provides for a fairly regular and periodic discharge of the accumulators, which otherwise might remain undisturbed for many days or weeks. As is well known, for economical use the storage battery should not be left either fully charged or entirely discharged for any length of time. Where the batteries are used for an ignition standby only, or are practically unused save for engine starting purposes, they are apt to deteriorate very rapidly.

#### One Effect of Magneto Wear.

In using magnetos which are equipped with plain armature bearings, care should be taken to see that the bearings do not wear to excess. If they do, there is some likelihood that the armature may be thrown enough out of the center of the tunnel through the pole pieces to permit it to rub. The effect of this would be to cause the insulation to be abraded from the outer turns of wire, thus producing short circuits and involving considerable expense in subsequent refitting, besides putting the instrument entirely out of business for the time being.

"The A B C of Electricity." Price, 50c. Motor World Pub. Co., 154 Nassau Street, New York City.

## THE MOTOR WORLD

### ASSISTS REMOVAL OF VALVE CAPS

Device that is of Service with Obstinate Caps Having a Castellated Flange  
—Method of Use.

Valve caps, of the sort which are adapted to use where the spark plug or petcock is inserted over the valve, are apt to prove difficult of removal occasionally when they have been in place for a long time, particularly if the threads have become "set" as a result of corrosion. In the case of those which are formed with a deep, female hexagon gripping surface, there is not as apt to be trouble as with those which are provided with a castellated flange, into which

VALVE CAP REMOVING TOOL

a corresponding tool is intended to fit when removal of the cap becomes necessary. With this arrangement it is not always an easy matter to hold the special tool in place while the necessary pressure is being applied to the handle. The result is that the tool is apt to fly off its seat, occasionally with uncomfortable consequences to the knuckles of the operator.

To obviate the difficulty a device has been contrived which is applicable to obstinate cases, and which is intended to take the place of the special tool, being operated by means of a large monkey wrench. As illustrated by the Autocar, its construction is relatively simple, as the accompanying picture shows. A trumpet-shaped casting is formed in such a way that the ears which project from its lower end are adapted to engage the notches in the castellated nut which forms the valve cap. Into its upper end is threaded a bolt of sufficient length to extend below the base, the lower end of the bolt being screwed into the shell of an old spark plug, while a nut and washer are run over the upper end.

In use, the spark plug or petcock is removed from the valve cap and the substitute plug, carrying the bolt, is screwed in place of it. Afterward the removing tool is set in position, with the end of the bolt projecting up through it, and the nut and washer run down over it "hand tight." When the wrench is applied to the hexagonal section

of the tool, the latter is prevented from working out of place by the pressure of the nut, and the required force can be applied to the wrench to start the cap without danger of the wrench being dislodged and flying off into space.

#### Far East Buying Motor Cars.

American automobile exports to the Far East have not made as great an advance as those of other countries. Siam, for instance, imported during the year 1909 seventy-eight motor cars valued at \$146,019, against 57 valued at \$96,900 in 1908; the United States, however, contributed but three cars, costing \$2,113, compared with 10 cars valued at \$7,362 during the preceding year. Of the total imported during the last year, 43 cars, valued at \$73,707, were from the United Kingdom, and fifteen cars, valued at \$32,187, from Germany. In addition to the motor cars, parts of automobiles to the value of \$27,880 were imported in 1909. One of the interesting features of the consular report containing the above information is the average price of the cars. While the average price of the English car exported to Siam was \$1,714, and that of the German \$2,146, the value of the average American car exported to Siam was but \$704. An increased demand for automobiles is expected to come in the next few years, as the roads are being improved greatly.

#### Ribbons to Help Window Displays.

Those dealers who place a proper value on attractive window display for either cars or accessories have an example in the case of a Philadelphia branch manager, who recently utilized what is sometimes known as the ribbon scheme. Staging a display car in the center of the window space, he attached ribbons to each of the principal features of the car, each ribbon being of a different color and terminating in a placard fastened to the window glass itself, where it could be read easily by spectators on the outside. Each placard gave a short "talk" as to the particular and peculiar merits of the part or feature of the car with which it was connected by its ribbon. The combination of the placards, the gaily colored ribbons and the car served successfully to catch the eye, and those who absorbed the information on the placards were well initiated into the main points of the machine and in what respects it was held by the manufacturer as being superior to others.

#### Fire Extinguishers for Commercial Cars.

Commercial vehicle users should find it wise to equip their machines with suitable fire extinguishers. The expense is slight, and the saving to vehicle and load in the event of a possible flare-up from the carburetter, or a mishap due to a leaking tank or feed pipe would more than compensate for the trouble of fitting it in a suitable and accessible manner and looking after its condition.

## WARNS BRITISH MANUFACTURERS

**London Times Discusses American Invasion and Lets Fall Words of Wisdom—Underrating Rivals Poor Policy.**

So marvellous are the production figures of American automobile factories to British eyes that fears are entertained in Great Britain that an American "invasion" of motor cars is imminent. These fears are so general that the London Times has deemed it proper to discuss the possibility editorially, and that "the Thunderer" is able to see things quite clearly, even when relating to things American, is made plain by the warning it gives the British makers against underestimating the character of the American product. The Times says, in part, as follows:

"For the present year the total American production is put at 200,000 cars of all kinds, and the question suggests itself: Can this large production be absorbed by the American market in addition to the 275,000 cars which are said to be already in existence in the country? The population of the United States is about double that of the United Kingdom, and its absorptive capacity for motor cars is no doubt more than proportionately greater. But 200,000 is a large mouthful to swallow, even when allowance is made for the Canadian market, which is almost completely in the hands of United States makers, and, if the domestic demand proves inadequate, efforts will naturally be made to dump the surplus elsewhere. In that event this country is as likely a field for the operation as any other; and, even apart from dumping proper, it is not improbable that some of the larger firms, in addition to those who are already selling here, will come to the conclusion that the British market is worth exploiting.

"In considering this contingency it is idle for British makers to lay the flattering unction to their souls that American cars are unsuited to British conditions, or to suggest that they will come to pieces on British roads, which on the whole, are probably superior to those enjoyed by the American motorist. The cars naturally differ among themselves, and so far as they can be regarded as a class they differ from those of British manufacture in such respects as design, material and methods of production. But one of the most striking differences is in price, and, however shy the British buyer may be in approaching a thing with the appearance of which he is not familiar, his diffidence is apt to be rapidly dissipated by an effective appeal to his pocket.

"If such an invasion becomes an accomplished fact, British manufacturers will not command success in holding their own

by underrating their adversaries, but they may strive to deserve it by dint of imitating their methods and reducing costs through producing standard patterns in large quantities, without introducing trifling variations to suit the particular whim of every customer. The practice of making endless special machines, instead of adhering to an adequate range of standard models, has been the bane of the industry, and, if it is persevered in, it will have equally untoward effects on the automobile industry in any struggle against outside competition."

### Tire Pressure Gauge in New Form.

That there are important points concerning an air tire gauge that sometimes are overlooked by the uninitiated is brought out in the presentation of the Safety tire gauge by the Safety Tire Gauge Co., of Chicago, Ill., a device which combines a pump connection of the quick acting

Eclair type and a gauge which indicates the actual pressure within the tire and not simply the pressure in the pump hose. As shown by the accompanying illustration, the gauge, which retails for \$1.50, has no glass, hands or frail parts to get out of order, and is small and compact. The gauge readings protrude at the side. When the device is attached to the valve stem of the tire the valve of the latter is opened, letting air back into the gauge. The air is kept from going back into the pump by a Schrader valve in the top of the gauge connection. The device has the further advantage of being light, compact, and not easily deranged.

### Chronological History of Old Concern.

Few automobile makers at present engaged in the American branch of the industry have a lengthier chapter of history than has the Stevens-Duryea Co., Chicopee Falls., Mass., a fact which is being emphasized in the chronological history of the Stevens-Duryea car, which is given in tabloid form in the early part of the new catalog of current models, and which shows mile posts in the progress of the car dating back for more than 19 years. The catalog itself affords an instructive summary of the special features which characterize the car, as well as throwing considerable light on the careful methods which are pursued in constructing it. It is almost needless to add that its typographical and pictorial features have been carried out in the distinctive manner peculiar to all the literature which is produced by this New England manufacturer.

## LIQUOR INTERESTS ARE AROUSED

**Resent Reflections on Their Business and Canceled Orders Result—Two Manufacturers Forced to "Take Water."**

Those automobile companies which either officially or through the personal action of their officers and representatives have become identified with prohibition or with opposition to the liquor interests are candidates for retaliatory measures by the liquor men which in some instances may prove costly from a purely business standpoint. The vigilance of the brewers and distillers in this respect is again made apparent by the publication last week of a letter written by the "wizard" of the General Motors Co., in which he assures the brewers that "the policy of the General Motors Company is to take no action which will in the remotest way interfere with the best development of your industry, which is a legitimate business, and holding a most important position among the leading manufacturing institutions of the country."

This enunciation of policy is regarded as so important by the General Motor "genius" that he uses paid advertising space to print it, suggesting an eagerness to placate and win the affections of the liquor interests rather than to encounter future experiences which might resemble those of Detroit manufacturers who have felt the penalty of antagonizing the brewing and distilling industries. Such antagonism in several cases has produced surprising and serious effects, made possible by the powerful co-operation of the liquor men in their common cause.

Among the notable instances is that resulting from the indiscretion of the advertising manager of a prominent Detroit company, in an address made before a billboard and advertising convention. The speaker expressed a low estimate of the billboard as an advertising medium for high grade automobiles, indicating that to his mind it was more valuable for beer and whiskey advertisements or other announcements calculated to appeal to the underworld who walk the streets at night. His words were such that the liquor interests construed a direct linking of their business with all that was vicious, criminal and immoral in city life.

The blow fell a few days later, when the Pittsburg agent of the automobile company was abruptly told that an order which he had obtained from a brewing concern for several large trucks was canceled. When he was asked the reason, he was told that since the makers, through their advertising manager, had chosen to cast slurs on the liquor business, they could not expect liquor men to purchase either their pleasure cars or their trucks, and that

throughout the country the liquor interests had placed a boycott on the company's products. Before the ban was raised, the president of the automobile company himself was obliged virtually to apologize for his advertising manager's words and to repudiate the latter's authority or responsibility in committing the company to a position of antagonism toward brewers and distillers. The advertising manager, who personally has no distaste for liquor products, is said to have held his job only by practically getting down on his marrow bones and swallowing a dose of humble pie large enough and heavy enough to choke most men.

In Michigan politics, the "wets" and the "drys" are waging such constant warfare that prohibition is one of the important and ever-present issues, and at least two prominent automobile officials have placed their respective companies on the liquor boycott list by reason of their political activity in favoring the "drys." As one of these companies is a General Motors constituent, there are perhaps excellent reasons for the "Napoleon of the industry" to declare in his letter to the brewers that "the company cannot assume responsibility for the individual or personal views of any of the thousands connected with the organization," but assuring them that "none of the various interests with which you are affiliated will have any just cause for complaint by reason of any action upon the part of this organization."

#### To Prevent Loosening of the Spokes.

Automobile wheels seldom give trouble as a result of shrinkage of the wood, in the way that carriage wheels generally do after they have seen a certain amount of use in extremely dry weather. Nevertheless, the bolts holding the hub flanges occasionally become loose, and if neglected this difficulty may ultimately lead to a loosening of the spokes themselves. On this account the nuts on all wheels should be gone over in connection with the regular overhauling of the car, care being taken to see that the tension on all of them is perfectly uniform, and that they are properly equipped with lock washers. If the spokes are found to be loose after this has been done, a liberal soaking generally will restore them to their proper condition.

#### Why Grease Gun Should Be Cleaned.

While it might not occur to the average motorist that so simple an implement as a grease gun should require any sort of special care, one point in connection with its use is deserving of special attention. At all times it should be kept clean and free from grit, especially with regard to the spout. Hence it should not be allowed to rattle about freely in the tool box with dusty tire irons or other tools which have been laid on the ground, nor should it be permitted to come into contact with sur-

faces which are dust-covered. Unless this precaution is taken there is a fair chance that sooner or later it will be the means of inoculating some of the bearings with a sufficient amount of grit to do considerable harm.

#### Tents for Automobile Tourists.

Instead of merely being the experiment of a few adventurous souls, automobile touring tents and camping outfits are being used to an extent that would surprise the uninitiated, as is made apparent by the numbers in which they are being marketed. A typical outfit of the kind, as supplied commercially, is offered by the New York Sporting Goods Co., of New York City, in the "Compact" automobile touring tent,

the nature of which is indicated in the accompanying illustration. Only a single pole made in three joints is required to erect it, and ropes are used to guy the rear wall to different parts of the car, or improvised stakes may be used if preferred. The complete tent, which retails for \$25, weighs 31 pounds, including the jointed pole and the carrying bag, and folds up in a space 36x7 inches. When it is spread, the tent is 9 feet front, 7 feet deep and 7 feet high, and will hold three cots or two cots, with room for a table and chairs between. If bags or blankets are spread on the waterproof flooring, four persons may be accommodated comfortably. For more than four people, two tents may be set facing each other, with an entrance between them and a fly stretched over the opening. A complete range of suitable equipment in the way of furniture, blankets, sleeping bags, lunch baskets, cooking outfits, serving sets and sundries also is available for the motoring tourist who desires to be independent of hotels.

#### Book that Deals with Dynamo Building.

Because the constructive impulse comes to every man early or late in life many authorities have been moved to write little handbooks which, metaphorically speaking, take young genius by the hand and lead him through the mazes of such simple tasks at the bench or the lathe as may be necessary to the achievement of his own particular bent. One such volume just has been issued by The Norman W. Henley Publishing Co., New York City. It is called "Dynamo Building for Amateurs,"

and deals with all the processes incident to the construction of a small dynamo or motor which may be used for gas engine ignition, or for running a small lathe, sewing machine or other light tools. The book, which is instructively written by Arthur J. Weed, should make useful reading for such as wish to become posted on the general principles of simple dynamo machinery without becoming deeply involved in troublesome mathematical or electrical complication of a theoretical nature which so often serve to confuse those who have not a mechanical bent.

#### When Kerosene or Water is Wanted.

Because the average inexperienced motorist is apt to be lacking in inventiveness, owing to his unfamiliarity with the mechanism of his car, it may be well to explain that when kerosene is needed to flush out a heated or gummy cylinder, or for cleaning purposes where for any reason gasoline is unsuitable, it usually may be found in the fonts of the dash lamps. Similarly, when lighting up time arrives on the road, where wayside brooks are not at hand and no farmhouses are in sight, it usually is possible to start the acetylene generator by means of water drawn from the radiator. Novices have been known to walk long distances in quest of one or the other of these fluids merely because they did not happen to remember that they had them right at hand.

#### Development of the Automobile Trunk.

Of the very many special demands born of the use of automobiles and which have required the development of old things in new shapes, the tourists' trunk is a good example. The Kamlee trunk is an excellent example of this development. As made for automobile use it is fitted with either two or three suit cases, access to the contents of which can be had by merely lowering the patent drop front of the trunk; articles in the bottom are, therefore, easily obtained without disturbing those on top. The trunk is rain-proof and dust-proof and can be had with cut-in back to conform to the tonneau of any make or type of car, while it is so built that it can be taken from the car and safely shipped as baggage.

#### Importance of Correct Gear Adjustment.

One thing in particular should be impressed upon the owner of the small car who is bent upon doing his own repair work. That is the absolute necessity of preserving the correct adjustment of the bevel driving gears. Unless the position of the two members in question is so regulated that the teeth meet and mesh uniformly throughout their entire lengths there is every probability that the rate of wear will be increased tremendously, while noise and increased frictional resistance also will result.

## CITES CHAIN DRIVE ADVANTAGES

English Expert Gives Reasons for its Earlier Faults—Increasing Use in Commercial Vehicle Practice.

Although the use of the chain drive has waned during the past two or three years, certain considerations make it appear that its day of usefulness to the automobile industry by no means has passed, but rather that new applications of it may serve to compensate for the loss as time goes on. For commercial vehicle purposes, for example, it is particularly well suited, especially in the case of those machines designed for extremely heavy loads. In certain types of friction drive, also, its use is considered essential, while very recent developments on both sides of the water appear to argue a growing use for the chain in replacing spur gearing for valve gear drive on engines. Even more remarkable, and no less promising, is the application of the silent type of chain in the gear boxes of omnibuses—this being a recent innovation in British practice.

With these considerations in view, no little interest attaches to a lecture upon the general subject of chain transmissions recently delivered before the Institution of Automobile Engineers of London, by A. S. Hill, an engineer who for many years has specialized in the construction and application of chains for all purposes and is thoroughly familiar with their possibilities and general advantages. Under the circumstances, it is noteworthy that he presented few radical arguments in favor of the chain drive and solid axle as against the shaft drive construction as applied to pleasure cars of medium size, but rather that he credited the designers of that type of mechanism with having secured a remarkable achievement.

"It was to be expected that automobile designers would look for other means of transmission on their vehicles, in view of the unfortunate experience of many chain users in the early days," he remarks, "and there was great inducement to manufacturers to study and spend money in an endeavor to perfect the live axle. All are agreed that they have succeeded in producing a piece of mechanism which does them infinite credit. No doubt troubles of no mean order were experienced in the development of the live axle," he adds, "and who can say that if the same amount of time, patience and money had been devoted to the further improvement of the chain drive there would be anything like the same disproportion in numbers between the live axle and chain driven cars as now exists?"

With reference to the early use of chain drive on motor cars, Mr. Hill explains that "they were generally acknowledged, by the

original designers, as a ready and convenient means to provide for transmitting the power to the road wheels, and to the chain must be credited no small part in the early development of the motor vehicle.

"All of us doubtless recollect and can picture some of the early types of chain-driven cars with driving wheels as small as 6-tooth, which quickly lost their form and became under-cut or 'hooked,' causing constant chain troubles. As time went on matters somewhat improved, the makers of motor vehicles being so progressive as to put 9 teeth in the driving pinions with certainly better results, but yet far from satisfactory.

"It will be conceded that at this time chain manufacturers made marked advancement towards perfection of manufacture, especially in the matter of bearing life, notwithstanding which chains were rapidly destroyed, the owners of automobiles buying new chains often without a thought of the wisdom of renewing chain wheels; thus the new chains were compelled to get out of pitch even quicker than the old ones which they had replaced.

"Gradually the motor car manufacturers learned by experience that if the wear was distributed over a greater area, the teeth would retain their correct form for a longer period, until eventually gears were being used with pinions as large as 20 teeth made of steel castings, or from mild steel, case-hardened, instead of bronze or malleable iron. The above remarks, as far as chain wheels are concerned, have been confined to the driving pinions because in nine cases out of ten they were mainly responsible for chain troubles. Noise of transmission was reduced as the important conditions here detailed received attention, and the next improvement was naturally to provide for all chains being properly encased and given a fair chance to prove their efficiency.

"During all this time the fact must not be lost sight of that the horsepower of the engines of automobiles had rapidly increased, as much as 40 to 50 horsepower being transmitted through a pair of 1¼-inch pitch chains of the single roller type, whereas previously the same size of chain was being used for 6 to 9 horsepower, and yet on the more powerful machines, under the improved conditions, the chains lasted much longer than on the lower horsepower vehicles. Results have been recorded of 18,000 to 20,000 miles with one pair of chains. Is it too much to say that chains and chain wheels were probably the most ill-used part of the mechanism of a car? Their very position subjected them to streams of mud or dust from the road wheels, and nothing more could be expected of such an accurately made piece of mechanism working under such unfavorable conditions.

"No doubt automobile designers have many awkward problems to solve, and unquestionably one is the designing of a

proper chain case permitting cleanliness and reasonable lubrication. At last several automobile manufacturers decided to so design their vehicles as to admit of suitable chain cases being provided, and the author is of the opinion that chain gearing, under these conditions, compares with distinct advantage as regards efficiency and most favorably as regards silence, with live axle cars."

Turning to advantages of the chain method of transmission as compared with that of the shaft drive and live axle, Mr. Hill continues:

"The live axle, no one will deny, forms a clean and well-housed piece of mechanism; but do not its benefits end here? It is not too much to claim for chains a higher efficiency for transmitting power than high-reduction bevel or worm gears. Positive in their nature, they have some degree of flexibility, and even when fitted in cases are fairly accessible. Chain's and chain wheels can be quickly renewed without great expense, and an alteration of gear ratios, to suit the particular district the car is generally required to travel in, can be easily effected. The flexibility of the chain drive permits of freedom for axle, spring and frame movement, without setting up undesirable strains, and enables the road wheel, when required, to be conveniently splayed.

"With the live axle practically the whole weight of the bevel drive rests directly on the tires—that is to say, the weight is not spring-supported, and is subjected to the direct shocks from the road wheels, with the result that the tires on the rear wheels generally wear much more rapidly on a car with shaft gear drive than on a car with double chain drive. One pound weight added to the axle is harder on both tires and axle than many pounds added above the spring.

"The application of chain drive to heavy motor lorries and tractors simplifies many of the problems connected with the design and running of these particular vehicles, and permits of a drive which meets the most exacting requirements. During the period when the chain troubles previously alluded to were sufficient to make an impression, there were very few commercial motor vehicles in existence, and by the time commercial cars began to command general attention the chain drive had been greatly improved, and designers generally realized the importance of good chain wheels with correctly formed teeth. It will doubtless be now conceded by the majority of automobile engineers that the chain drive for commercial vehicles has demonstrated its superiority to the live axle, and there is little prospect, at present, of it being superceded. The torsional strain put on the frames of this class of vehicle is very considerable, and the chain lends itself, to a great extent, to the distortion without any appreciable harm.

"The fitting of chains as a means of transmitting power to the driving wheels of such vehicles at once dispenses with the large and heavy axle case with split axle, necessary when gear drives are employed, and permits of the use of the only satisfactory axle that can be used for carrying heavy loads—namely, a solid one. While thus reducing the total unsprung weight on the driving wheels to a minimum, a relatively stronger axle can conveniently be fitted, and the removal of the differential gear to the driving end of the chains, where it is protected from road shocks and axle strains, allows of a lighter gear being fitted, by reason of the increased speed at which it transmits the necessary power, and incidentally permits of more efficient lubrication there.

"Axle clearance with gear drives is very limited, but with chain driving of the road wheels it is easy to obtain an axle clearance practically equal to half the diameter of the driving wheels. The size of the road wheel can, with chain transmission, be made suitable to carry the required load without being influenced by the ratio of reduction between the gear box and axle by reason of the wide limits of ratios possible with this type of drive. The ratio of reduction can at all times be conveniently altered to suit varying conditions of road service, by the changing of sprockets and detachment or addition of one or more chain links. With chain drives torque roads are not required, and the absence of universal joints provides a transmission with an efficiency higher and more easily obtained and retained than is possible with other forms of mechanical drives.

"To automobile designers of the present day, to get best results from chain drives to the wheels, the author would submit the following points: The pinion should have from 17 to 20 teeth to suit chains of the 'inverted' tooth type for preference, and of a pitch and width suitable for the weight of the vehicle and power to be transmitted. The ratio of wheels not more than  $2\frac{1}{2}$  to 1. Pinion wheel of mild steel, case-hardened. The larger chain wheel, or wheels, should be made of steel castings, or mild steel, case-hardened, and for preference should be in the nature of a simple, plain ring or bolt on to the brake drum or bracket. The automobile designer should consult with the chain manufacturer as to correct tooth forms and wheel diameters. The whole chain gear should be cased in with a strong case easily detachable or easily accessible, and provision should be made for a drip lubricator on the top of the case which should only drop oil on the chain when the car is in motion.

"Such a drive would compare favorably for silence, and would be less severe on the tires than the live axle. It would be cheaper to instal, and would have longer life and is easier to alter ratios."

In regard to novel and special applica-

tions of the chain drive in automobile practice Mr. Hill has this to say:

"Although heated controversy resulted from the application of the 'inverted' tooth type of chain to the cam shaft drive of petrol motors, the results obtained have amply justified expectations.

"Coventry 'noiseless' chains were fitted to the two 'Knight' Daimler engines used in the now famous test carried out by the Royal Automobile Club, and some details regarding the condition of these, after running constantly at a speed of some 1,000 feet per minute under their maximum load, may be interesting and instructive. The two chains used were  $\frac{5}{8}$ -inch pitch, and on completion of the test were found to have elongated in their total length of 42 and 43 pitches by 3.64 and 1.16 inches, respectively, this difference being due to the former chain being used on the 38 horsepower and the latter on the 22 horsepower engines. The wear on the link faces was such as to still leave the marks of the machining visible, and the average wear on the bush and rivet diameters was .0005 inch and .0006 inch, respectively. An equivalent road mileage under such severe conditions as the above test would approximate 7,000 miles, during which time the chain would have itself traveled over the wheels some 8,000,000 feet.

"It will be noted that the centers of this drive are particularly close—no adjustment is provided, and the conditions generally are extremely stringent. Should the chain elongate more than 3-16 inch in a length of 25 inches its usefulness for this special purpose would probably be expended. For this particular drive, every chain is required to be within the total limit of .020 inch in its total length.

"Many firms are now considering the chain drive on the ordinary cam shaft, and in each case where tests have been made all the success expected of it has been realized. In every case it has proved, beyond question, to be quieter in action than spur gearing.

"The chain driven gear box as fitted to the motor omnibus is somewhat of an innovation. Spur gears proving troublesome for noise, the chain manufacturer came to the rescue, and the scheme has proved a great success; although the initial gear has not run more than 5,000 miles, there is every indication that it will prove to have considerably longer life than the spur gears which they displaced.

"The magneto drives come under the heading of the minor uses to which the chain is applied on motor vehicles. As small a chain as 8 millimeters pitch of the roller type can be used with excellent results on motor bicycles. It is now common practice to have them neatly enclosed in a case, which adds to the efficiency and general appearance. Both the ordinary bicycle roller chain and  $\frac{1}{2}$ -inch pitch 'inverted' tooth type of chain are being used for

magneto driving on the automobile; the same types of chains are being used also for pumps, fans, and for driving small dynamos for producing electric light."

#### **Wants \$500 Damages Added to Wages.**

The question of whether or not an employe of a taxicab company is entitled to "damages" has developed a new wrinkle in Buffalo, N. Y. George Benham, a chauffeur, sued the International Railway for \$500 damages for injuries which he sustained when a trolley car ran into his taxicab and threw him to the street, and which he claimed incapacitated him for three weeks. In court it was proven that, although Benham did not show up at the garage for nearly three weeks, the taxicab company, knowing the accident was no fault of his, paid his regular wages during that time. This unexpected turn in the trial caused Judge Maul to reserve his decision.

#### **Limousines as Photographic Studios.**

Heeding the maxim "Time is money," a Hamburg photographer has installed something new in the line of photographic appliances. He ordered a large limousine, fully equipped as a photographic studio, with several cameras, dark room, laboratory, etc. Wherever events of importance take place, the traveling studio will attend, take pictures, develop them and sell prints ready to take home within a few minutes of the event. In racemeets, games, aviation and other sporting contests, faithful photographs of the participants, their machines and the main incidents of the meet will be for sale before the echoes of the applause have died away.

#### **Extra Bodies for Garbage Wagons.**

As a means of saving time and labor, the street watering and dust collecting automobiles of London, Eng., have interchangeable bodies. As soon as a truck is loaded, it is driven to the dumping places, backed up against a ledge supporting the back portion of the load, while the front is raised on a sling. The chassis is then driven from under the hanging body, backed under an empty one, and starts off on its next collecting tour. It is said that the plan works admirably, saving much time which would be wasted in waiting for the car to be emptied.

#### **Exploding Tire Causes Death.**

That an automobile tire may explode with sufficient force to cause death was demonstrated on Decoration Day, at Chester, Pa. Frank D. Marshall, aged 45 years, was killed in the yard of his home by the explosion of an automobile tire which his brother-in-law was inflating. The inner tube struck Marshall across the face, lacerating him so severely that he died soon after his removal to the Chester hospital. The tire was an old one and showed evidences of being rim-cut.

## RECENT PATENTS.

956,033. Supplemental Spring for Automobiles. Brenton D. Bishop, Boston, Mass. Filed Aug. 31, 1908. Serial No. 450,954.

1. The combination with a motor vehicle provided with leaf supporting springs, of supplemental springs each comprising a coil having arms extended in the same direction and bent at their ends in the plane of said arms to form eyes having their axis parallel with the axis of the said coil, and bolts passing through said eyes to connect the leaf spring with the framework of said vehicle.

956,060. Automobile Wagon. Martin V. B. Ethridge, New York, N. Y. Filed July 10, 1907. Serial No. 382,972.

1. In a motor vehicle, the combination with a body of a rear axle fixed against turning on the body, a front axle pivoted to the body, a steering shaft journaled in the body and having a sheave at its lower end, a tongue fixed to the front axle and extending rearwardly beyond and beneath the rear axle, depending idlers journaled on the rear axle on opposite sides of the tongue, and cables wrapped upon the

sheave and passing about the idlers, said cables being fixed to the rear end of the tongue adjacent to the axle.

956,089. Transmission Gearing. William W. Henderson, Washington, D. C. Filed Nov. 12, 1909. Serial No. 527,739.

1. The combination of a rotary driving member, a driven shaft on which said member is loosely mounted and around which said member rotates, a reversing gearing between the shaft and the said member, a clutch device for reverse drive between said gearing and the shaft, and located on the opposite side of said member, and means to shift the shaft lengthwise to engage one of said clutch devices and disengage the other.

956,110. External Guard for Pneumatic Tires. Joseph L. La Driere, Albuquerque, N. M. Filed Jan. 21, 1910. Serial No. 539,360.

In an external guard for pneumatic tires the combination of a plurality of sections each of which has a longitudinal central portion, a knuckle at one end thereof, spaced knuckles at the opposite end of said longitudinal central portion, and curvilinear

skirts extending from opposite sides of said portion and flanged at one end; transverse pintles extending through the aligned knuckles of the sections and connecting the sections together in a hinged manner to one of the first named sections and having a longitudinal central portion and curvilinear skirts and also having apertured lugs and guard flanges on said skirts, threaded bolts arranged inside the guard flanges and extending through the apertured lugs of the two end sections, and nuts arranged inside the guard flanges and mounted on the bolts at the outer sides of the apertured lugs, all substantially as specified.

956,191. Universal Joint. Louis Schwitzer. Indianapolis, Ind. Filed March 22, 1909. Serial No. 484,857.

1. A universal joint including two members with a pair of oppositely located projections extending from the end of each and so that the projections on the two members may interlock each of said projections having one side surface flat and the other side surface recessed, plugs fitting between the adjacent surfaces of said projections and in the recess thereof and with a flattened surface bearing against the flattened surface of the projections so

as to be slidable thereon, the external surfaces of said projections being spherically disposed, a spherically disposed band transversely surrounding the joint, and means for securing said band to said plugs.

956,221. Magnetic Tachometer. John K. Stewart, Chicago, Ill. Filed Nov. 16, 1908. Serial No. 462,755.

1. In a magnetic tachometer, in combination with a case, an armature disk mounted on the case wall and inclosing a chamber within the case, a post within the case coaxial with said chamber, a magnet carrier mounted for rotation on the post, a carrier actuating shaft journaled in the case wall and projecting into the chamber, for rotating the carrier; a low resistance disk positioned between the armature disk and one end of the carrier and mounted for oscillation about the axis of rotation of the carrier, such carrier being provided with a plurality of peripheral recesses, and horse-shoe magnets mounted in such recesses

956,491. Auto-Drive Boat. John W. Freeman, Joplin, Mo. Filed Oct. 6, 1908, Serial No. 456,359. Renewed Nov. 20, 1909. Serial No. 529,096.

1. A boat arranged to receive an automobile, a pair of independently operable propelling devices, independent connections between the driving wheels of the automobile and the propelling devices, and means for independently controlling the speed of rotation of the driving wheels.

We are now making 25,000 bearings per day, and increasing output as rapidly as possible.

A case where quality is recognized and put to use.

**Wetherill Finished Castings Co.**  
PHILADELPHIA, PA.

### GETS \$50 INSTEAD OF \$20,000

**Pierce Loses Suit for Value of Four Cars Destroyed in Transit—Express's Valuation Clause Upheld.**

Alarming and in the nature of an "eye-opener" to automobile manufacturers and others who have occasion to ship cars or valuable consignments of accessories by express, a remarkable opinion has been enunciated in the United States District Court, for the Northern District of New York, by Judge Holt, the result of which was the return of a verdict for \$50 as the damages to which the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., is entitled from the loss of \$20,000 worth of cars and accessories destroyed in an express shipment. The limitation of the damages to \$50 is due to the fact that the Pierce-Arrow company placed no declared value on the goods in giving them to the express company for transportation.

Four automobiles, a body and a number of accessories were shipped by the Pierce company in March, 1907, by Wells-Fargo express to San Francisco, Cal. The shipment was destroyed by fire in the derailing of a freight car on the Atchison, Topeka & Santa Fe railroad. Because of the loss, the Pierce company brought suit for \$20,000.

In the hearing of the case before Judge Holt, at Rochester, N. Y., on the first of this month, the attorney for the express company based his resistance to the awarding of more than \$50 damages on the ground that when shipping the goods the Pierce company chose to sign a regular bill of lading and refused to put a valuation on them. The usual express receipts, such as the automobile company was given, contain the following clause:

"Charges are based upon value, and the liability of the express company is limited to \$50, unless a greater value is declared at the time of shipment."

Judge Holt upheld the counsel for the express company in his contention that the Pierce company, having refused to declare a greater value than \$50, could not recover damages in excess of that amount. The jury was directed to return a verdict of \$50, with interest, for the plaintiff.

### Springfield Changes Name to Bayfield.

The Springfield Motor Car Co., which a year or so ago removed from Springfield, Mass., to Springfield, Ill., and which made an ambitious attempt to produce "assembled" automobiles, has been succeeded by the Bayfield Motor Car Co., which has been organized with \$150,000 capital to take over the business. Dr. C. H. Medcraft, the former manager, has severed his connection with the enterprise, but the stockholders in the old company control the new corporation.

### Marathon's Makers Move to Nashville.

The Southern Motor Co., which has been making the Marathon car in Jackson, Tenn., is removing to Nashville, where it has purchased Mill A of the Phoenix Cotton Mills for a factory. Nashville capital has been obtained for the company, which has been reorganized with \$400,000 capital stock. A. H. Robinson has been made vice-president, with J. H. Fisher as secretary and treasurer, while Exile Burkitt, the president, will continue in office.

### Dodges to Build Big Parts Plant.

Dodge Brothers, of Detroit, Mich., manufacturing machinists, who for some time have been making automobile parts, have completed plans for the building of a \$750,000 plant for this purpose. It is to be put up on a 24-acre site on Joseph Campau avenue.

### Pelletier Sails for European Sojourn.

E. Le Roy Pelletier, advertising manager of the E-M-F Co., of Detroit, Mich., sailed on Saturday, 4th inst., with Mrs. Pelletier, for a European sojourn. He will return in about three months.

### ABBOTT FIRST TO FILE ANSWER

**One of Michigan "Independents" Outlines its Defense in Selden Patent—Makes Some Embittered Allegations.**

If the vigor and warmth of the first answer to be filed in the batch of Selden prosecution cases recently brought by the Columbia Motor Car Co. and George B. Selden against a number of Michigan "independents," are to be taken as indications of the liveliness of the legal battle which the defendants are to give the Selden forces, the contest promises to be quite sharp and bitter.

Although the respective defendants have entered their appearance, the Abbott Motor Co., of Detroit, Mich., is the first to file its answer, which it did on the 3rd inst. in the United States Circuit Court at Detroit. Since a certain measure of co-operation and common cause is supposed to obtain among the various defendants in resisting the Selden prosecution, the answer which has been filed by the Abbott company may be taken as signifying the general character of the defensive plan.

All manner of allegations are made against the Association of Licensed Automobile Manufacturers in the Abbott answer, which is a voluminous document. It asserts that the principle features of the alleged Selden invention were disclosed in printed publications in this and foreign countries two years prior to the date of application for the Selden patent, and that the essential points thus became publicly known and were publicly used two years before the patent was asked for.

It denies the right of the complainants to bring action against the Abbott Motor Co.; charges Selden with postponing the issue of his patent for the "fraudulent purpose of extending the life of the letters when granted," and charges, also, that he copied into his invention the ideas and inventions

of others, relating to the construction of self propelled vehicles.

"Masked and disguised under Selden patent 549,160," the Columbia company, according to the defendant company, is "conspiring to enhance profits from the manufacture and sale of automobiles, not only in restraining its own trade in manufacture, sale and production, thus increasing prices, but in attempting to stifle competition, in particular as to defendant company, and prevent the manufacture and sale by defendant of automobiles."

As additional evidence of the alleged conspiracy, the Abbott company charges interference with its agents by the complainants. It asserts the Selden patent has scarcely two and one-half years life before its expiration and alleges:

"That manifestly it is the intention and policy of the Columbia Motor Car company and the Association of Licensed Automobile Manufacturers, who own and control its product, to bring suit under the patent and harass competitive automobile manufacturers, compelling them to expend large sums of money in the courts."

The Abbott company alleges it is not the purpose of the complainant that these cases be brought to trial. In this connection it petitions the court that the case may be ordered to an immediate issue; that the complainant and the A. L. A. M. be restrained from threatening the Abbott company or its customers with further suits on the Selden patent, from, in any manner, hereafter interfering with agents or employees of the Abbott company, and from interfering with the credit of the Abbott company by letters, threats, etc.

It is alleged that the complainant corporation has no right to determine who shall receive licenses under the Selden patent and that a large proportion of the royalties derived from these licenses are retained for the purposes of the association in maintaining a "price committee," "trades committee," "agency control committee," and "association patents company committee."

The duties of these committees, the Abbott company says, "consist solely in making arrangements and undertakings whereby commerce between the various states and territories and foreign nations in said automobile industry is sought to be controlled."

The answer is filed by Attorneys Abbott & Abbott and lists as additional legal representation Offield, Towle, Graves & Offield, with Chas. K. Offield as counsel.

#### Weston is Made Mercer's Manager.

Frank F. Weston has been appointed general sales manager of the Mercer Automobile Co., of Trenton, N. J. A veteran of the bicycle industry, Weston for the last few years has been acting as a factory sales agent for automobile accessories, parts and materials.

## NEW FACTORIES BEING PROJECTED

### Promotion Movement is Manifest in Five Cities—Financial Assistance is to be Requested from Investors.

Little Rock, Ark., may become an automobile manufacturing town, if the efforts of William L. Tedford, president of the Tedford Auto Co., can make it such. He is organizing a company to make a car styled the "Arkansaw Traveler."

Exeter, N. H., is considering the proposal of Joseph Symonds, president of the Exeter Machine Works, for a \$90,000 motor car manufacturing plant. Symonds asks that the citizens of Exeter subscribe \$30,000, and a committee has been appointed to see whether the plan is feasible.

Investors in Augusta, Ga., shortly are to be asked to subscribe for the stock of a local automobile manufacturing enterprise known as the New South Automobile Co., which has asked for a charter that will permit it to have a capital of \$1,000,000 if desired. L. J. Williams, the moving spirit in the enterprise, has acquired the old street car barns site in Augusta as a location for the factory.

Utica, N. Y., is to give birth to a new automobile manufacturing company which is to make eight-cylinder cars, according to the plans of John K. Gunn, of the Utica Pipe Foundry, who with several other local business men is organizing a \$200,000 concern. The eight-cylinder motor which is to be used, and which was designed by Gunn, has been on trial for some time in the chassis of a standard six-cylinder car.

Viewing their automobile building proposition with entire favor, the Chamber of Commerce of Alpena, Mich., has accepted the terms offered by C. H. Nunnelly and H. V. Grosbeck, of Mt. Clemens, Mich., by which the latter are to build and operate a motor car factory in Alpena. Nunnelly and Grosbeck are to furnish \$30,000, Alpena business men are to take \$20,000 worth of stock, and the city of Alpena is to provide a free site and \$50,000 bonus. It is proposed to manufacture a 35 horsepower roadster to sell for \$1,600.

#### New Factory for Klaxon Horns.

The Lovell-McConnell Mfg. Co., of Newark, N. J., have taken possession of their new factory at 194-212 Wright street and 139-141 Emmet street. The building provides 40,000 square feet for the manufacture of Klaxon and Klaxonet alarm horns.

#### Federal Withdraws Tire Quotations.

Advances in tire prices are threatened by a number of the tire makers because of the continued high price of rubber. The Federal Rubber Co., of Milwaukee, Wis., has

announced that "owing to the abnormal conditions controlling the prices of crude rubbers" all prices covering solid and cushion vehicle tires manufactured by the company are withdrawn and that new prices will be in effect on June 15. Increases in the quotations for pneumatic tires are intimated by several makers as being likely if rubber prices do not come down in the meanwhile.

#### E-M-F Employees Get \$50,000 Gift.

As a reward to the factory forces for maintaining a high rate of production, the E-M-F Co., of Detroit, Mich., has arranged to give three days' vacation with pay to all the employees at its several plants during the week of July 11, when the Elk's convention takes place in Detroit. The factories will shut down on July 14, 15 and 16. As the daily pay roll of the company is over \$17,000, the total cost of the vacation period, from the company's standpoint, is over \$50,000.

#### Imports Still on the Down Grade.

Automobile imports from abroad during the month of May amounted to only \$218,252.40 compared with \$358,496.89 in May, 1909. During the past month only one hundred cars were imported at an average value of \$2,182 each, while during the same period of 1909 199 motor cars entered the port of New York, showing an average value of \$1,811 each.

#### Baines Dies of Ptomaine Poison.

James F. Baines, service manager of the Packard Motor Car Co., Detroit, Mich., died at his home in Windsor, Ont., on the 5th inst., from heart trouble due to ptomaine poisoning with which he became ill in Boston, Mass., while on a business trip. He was 35 years old and formerly was assistant general auditor of the Lake Erie railroad.

#### Gauge Makers Get Wisconsin Factory.

The National Gauge and Register Co., of Minneapolis, Minn., manufacturing tire gauges and other automobile specialties, has secured a factory in LaCrosse, Wis. Inducements were offered by the LaCrosse Industrial Corporation, recently organized with \$125,000 capital, for the purpose of town promotion.

#### American Abandons Lafayette Project.

The American Motor Car Co., of Indianapolis, Ind., has decided definitely not to establish a plant in Lafayette, Ind. The subscribers to the subsidy fund in the latter place are having their money returned to them.

#### Oswald to Make Motors in Goshen.

The Oswald Motor Co., of Goshen, Ind., has obtained a site for a two-story factory. The company is preparing to make automobile motors.

**WOOD FOR BODIES IS "CORNERED"**

**Michigan "Wizard" Sends Prices Skyward  
by Heavy Purchases of Poplar—Makers  
Take to Metal Bodies.**

Not only is the Michigan merger "wizard" busy with the multifarious duties of financing the General Motors Co. and exercising a watchful care that the quotations on its shares shall be kept at a respectable figure, together with the activities incident to multiplying real estate values in the various cities where the plants of the "trust" are to be expanded so greatly, but he also would appear to be concerned in an attempted "corner" of one of the materials extensively employed in motor car building. This material is poplar wood, which is used for automobile bodies and for a number of minor purposes, and poplar wood, it seems, has been "cornered."

Poplar for some time has been steadily climbing, and from a price around \$90 a thousand has touched \$150 a thousand in some instances, in the grade necessary for good body work. Just why it should take this altitudinous course was something of a puzzle until it transpired that agents identified with the "wizard's" operations had been buying up all the available stock in such quantities as to point to an effort at controlling the market. The quantity bought, even when matched against the prospective output of the "trust" plants for a long, long time to come, was very much greater than the purchasers would need under ordinary conditions.

But as an offset to this unhappy condition in the poplar market, there has arisen a condition which ameliorates some of the difficulties it presents. It comes about as a discovery on the part of many automobile builders who heretofore have been using poplar, that the latter is not really a necessity in their business, and that, with everything considered, they can do better in buying metal bodies than in paying fancy prices for wood. In fact, the poplar "corner" has given an additional impetus to the use of metal bodies, and the automobile manufacturers who have been weaned away from wood bodies exhibit a disinclination to bother about being re-converted.

**Haradon Heads Trade Association.**

Following a brief period of service as president of the New York Automobile Trade Association, in filling out the unexpired term of General John T. Cutting, who resigned to cast his lot with the licensed dealers' organization, Wm. M. Haradon has been re-elected to that office. At the annual meeting of the association, which was held at the Hotel Cumberland on Monday of this week, these officers also were

chosen: C. W. Wurster, of Wyckoff, Church & Partridge, first vice-president; W. W. Burke, of Carl H. Page & Co., second vice-president; W. H. Yule, of the B. F. Goodrich Co., of New York, treasurer; Walter R. Lee, secretary and general manager. Secretary Lee enters upon his fourth consecutive term. The directors are: C. Andrade, Jr., of the R. M. Owen Co., who also is counsel for the association; W. A. Evens, American Locomotive Co.; J. E. Harlam, of the Sagamore Garage Co.; E. H. Broadwell, of the Fisk Rubber Co.; Peter Hoyt, of Hoyt & De Mallie, Inc.; C. H. Larson, of the Oldsmobile Co., of New York; W. C. Poertner, of the Poertner Motor Car Co.; and A. J. Inderreiden, of the Warner Instrument Co. The automobile dealers, garagemen and accessory manufacturers thus have four representatives each on the board.

**Will Handle Imported Materials.**

For the purpose of handling the American sale of the products of five French makers of automobile materials and parts, J. K. White, who until recently was connected with the New York agency for Lemoine and RBF products, has organized the French Steel Products Co., of New York City. The new company will represent Jacob Holtzer & Cie, makers of fine steel for gears, forgings and springs; Plichon Freres, makers of iron cylinder and piston castings; Societe Metallurgique Montbard-Aulnoye, makers of pistons, axle tubes, shaft tubes and forgings; Forge Persan Beaumont, makers of front axle forgings and chassis springs; and MAB ball bearings.

**Fire Damages to Gilbert Factory.**

Fire on the 7th inst. visited the building in which the Gilbert Mfg. Co., of New Haven, Conn., is located. The total damage by fire and water was \$25,000, of which the Gilbert company suffered a part, although it is not thought that the company's delivery of tire jackets, carbureters and other motor car specialties will be interrupted.

**Kansas Company Produces a Truck.**

The White Star Auto Co., which was organized in Pleasanton, Kan., last fall, has developed a car which is marked by four wheels steering and drive. The capital stock of the concern is to be increased, for the purpose of erecting a factory for the building of cars, trucks and motor farm wagons embodying four-wheel steering.

**Quaker Dealers Open Headquarters.**

The Philadelphia Automobile Trade Association, of Philadelphia, Pa., has established a trade headquarters at the southwest corner of Broad and Callowhill streets. J. H. Beck, the secretary of the organization, is in charge.

**RAISES CAPITAL TO \$30,000,000**

**United States Motor to Make Provision for  
Stoddard-Dayton Deal—Briscoe Calls  
Stockholders' Meeting.**

The absorption of the Dayton Motor Co., of Dayton, O., by the United States Motor Co., which a month ago was indicated by the Motor World as being in process, is scheduled for consummation on June 15, and to provide for the acquirement of the Dayton property and others, the United States Motor Co. on that date will increase its capitalization from \$16,000,000 to \$30,000,000. A special meeting of the stockholders, in Jersey City, N. J., has been called for the purpose, when the preferred stock will be raised from \$8,000,000 to \$15,000,000 and the \$8,000,000 of common similarly expanded.

In taking over the Dayton Motor Car Co., which manufactures the Stoddard-Dayton cars, the United States Motor Co. also will add to its list of properties the Courier Car Co., of Dayton, a younger concern, which is controlled by the interests in the Dayton company and which makes the Courier car, ranging under the Stoddard-Dayton line in price. The Stoddard-Dayton plants are two in number, while the Courier has a separate plant of its own.

It is understood that the transfer to the merger corporation is to be effected by an exchange of shares. An inventory of the three plants in Dayton has been taken with a view to determining the physical assets involved, although the purchase price is to make adequate provision for the patents and intangible assets. Little or no change is anticipated in the management of the plants, except insofar as their capacity and production is to be increased.

In a circular to United States Stockholders, Benjamin Briscoe, the president, indicates that at the June 15 meeting they will be called upon to approve recent deals entered into by the directors, and that the intended increase in capitalization is not only for the Stoddard-Dayton and other purchases but is also for the purpose of affording a working capital that will make the company independent of the market for commercial paper. Reference also is made to the fact that on May 1 the company completed its first three months of business, and that in addition to paying a first quarterly dividend of 1¼ per cent., it has established a reserve fund to provide for accruing dividends on such stock, after which the surplus profits may be applicable to dividends on the common stock. The circular reviews the successful operations of the company in Maxwell, Brush and Columbia cars and in Alden Sampson motor trucks for the first three months' period.

## THE WEEK'S INCORPORATIONS.

Detroit, Mich.—Carey Motor Car Co., under Michigan laws, with \$5,000 capital.

New York City, N. Y.—Twombly Motors Co., under New York laws, with \$1,000,000 capital.

Buffalo, N. Y.—United States Auto Station, under New York laws, with \$5,000 capital; to do general garage business.

Detroit, Mich.—Automobile Engineering and Mfg. Co., under Michigan laws, with \$1,000 capital; to deal in automobile motors and parts.

Jacksonville, Ill.—Jacksonville Automobile Co., under Illinois laws, with \$2,500 capital. Corporators—N. Broadwell, G. B. Andre, and others.

Fort Worth, Tex.—Lone Star Motor Car Co., under Texas laws, with \$25,000 capital. Corporators—E. R. Vernon, A. C. Alexander, M. A. Arnold.

Toledo, Ohio.—Ohio Motor Sales Co., under Ohio laws, with \$10,000 capital; to deal in automobiles. Corporators—M. Osborn, William Pratt and others.

St. Louis, Mo.—Major Motor Car Co., under Missouri laws, with \$15,000; to deal in automobiles. Corporators—R. L. Major, W. H. Little, George S. Foster.

Butte, Mont.—Butte Taxicab Co., under Montana laws, with \$40,000 capital; to operate taxicabs. Corporators—C. E. Shewe, C. L. Mitchell, Dora S. Mitchell.

Chicago, Ill.—Lloyd Auto Garage Co., under Illinois laws, with \$5,000 capital; automobile garage and livery. Corporators—W. I. Rudd, C. W. Ford, G. H. Lloyd, J. E. Davis.

New Haven, Conn.—Rally Rubber Co., under Connecticut laws, to manufacture automobile tires and other rubber goods. Corporators—Charles Hofacker, H. S. Rally.

Chicago, Ill.—Shaw-Merillat Co., under Illinois laws, with \$10,000 capital; to deal in motor vehicles and appliances. Corporators—H. I. Shaw, E. R. Bliss, Jr., Lloyd Merilat.

Chicago, Ill.—Hayes Avenue Garage Co., under Illinois laws, with \$5,000 capital; general automobile merchandise. Corporators—C. Kleinfelder, A. R. Pearson, Charles B. Obermeyer.

Chicago, Ill.—Junkers-Burdick Co., under Illinois laws, with \$25,000 capital; to do automobile and general merchandise business. Corporators—Otto Junkers, W. Burdick, George J. Meier.

Sandusky, O.—Sandusky Auto Parts & Motor Truck Co., under Ohio laws, with \$150,000 capital. Corporators—James M. Woods, D. E. Storms, O. T. Snyder, B. M. Freeman, Simeon Nash.

Portland, Ore.—Auto Delivery Co., under Oregon laws, with \$35,000 capital; to deliver packages and merchandise. Corporators—F. E. Harlow, P. E. Beam, C. E.

Runyon, S. P. Huston, F. A. Young, J. H. Hall.

New York City, N. Y.—Queens Boulevard Garage, under New York laws, with \$5,000 capital; to do general garage business. Corporators—G. J. Glaser, N. C. Glaser, Clarence M. Davis.

Bellaire, Ohio.—Poorman-Morris Co., under Ohio laws, with \$5,000 capital; to deal in automobiles. Corporators—J. F. Johnson, J. F. Poorman, W. H. Morris, Ella Morrell, D. D. Dubois.

Camden, N. J.—Falcon Motorcar Mfg. Co., under New Jersey laws, with \$125,000 capital; to manufacture automobiles and motor cars. Corporators—Frank A. Kuntz, Joseph P. Murray, Wm. S. Kell.

Springfield, Ill.—Rayfield Motor Car Co., under Illinois laws, with \$150,000 capital; to manufacture and deal in automobiles, accessories and supplies. Corporators—J. F. Miller, E. E. Staley, Burke Vancil.

Detroit, Mich.—McCrary Motor Co., under Michigan laws, with \$5,100; to manufacture and deal in automobiles and accessories. Corporators—C. R. McCrary, John G. Staling, Jay F. Pool, George W. Edson.

New York City, N. Y.—Modern Transmission Mechanism Engine Co., under New York laws, with \$25,000 capital; to manufacture and deal in motors, engines, etc. Corporators—G. Randolph Jaeger, Fred W. Jaeger, Frank Eveland.

Hackensack, N. J.—Baldwin Motor Service Co., under New Jersey laws, with \$250,000 capital; to manufacture and deal in automobiles. Corporators—T. H. Baldwin, Hackensack; F. Kaegebehn, Brooklyn; G. C. Norwood, New York City.

Kingston, N. Y.—W. A. Wood Automobile Mfg. Co., under New York laws, with \$3,000,000 capital; to manufacture automobiles, engines and appliances for automobiles. Corporators—Wm. A. Wood, Chas. W. Kahlerth, Francis Fitch.

New York City, N. Y.—Bretton Hall Garage Co., under New York laws, with \$50,000 capital; to keep garage, repair automobiles, and deal in accessories. Corporators—M. A. Cramer, S. Meyer and J. Fisher, all of New York City.

Jamestown, N. Y.—Jamestown Wheel & Mfg. Co., under New York laws, with \$25,000 capital; to manufacture and deal in automobile parts, wheels, accessories, motor vehicles and tools. Corporators—G. M. Thompson, H. K. Shaver, L. O. Todd.

Nashville, Tenn.—Selmer-Savannah Auto & Hack Line, of McNairy County, under Tennessee laws, with \$10,000 capital; to operate automobile stage line. Corporators—H. P. Wood, Hume Whitehurst, J. C. Williams, W. K. Abernathy, S. W. Gooch, C. C. Wright.

New York City, N. Y.—R. G. Green, Inc., under New York laws, with \$5,000 capital; to manufacture, deal in and repair automobiles, carriages and motorcycles. Cor-

porators—R. Granville Green, Mabel L. Kirkham, all of 118 East 126th street, New York City.

Wilmington, Del.—International Pneumatic Auto Wheel Co., under Delaware laws, with \$1,000,000 capital, to manufacture automobile wheels under letters patent. Corporators—C. M. Saulson, G. D. Edwards, of New York City; H. W. Davis, of Wilmington.

New York City, N. Y.—Sears-Cross Co., under New York laws, with \$30,000 capital; to manufacture and deal in motor vehicles, speedometers and other appliances. Corporators—P. Muller, Brooklyn; E. S. Gellatly, New York City; W. F. Kendall, West Haverstraw.

Hartford, Conn.—American Rotary Machine Co., under Connecticut laws, with \$2,000,000; to manufacture newly patented rotary engine, under license of and agreement with the Internationale Rotations-Maschinen Gesellschaft of Berlin, Germany, and A. Keith Baylor of London, England. Corporators—A. K. Baylor, E. M. Sairtelle of Englewood, N. J., and James H. Byrne of New York City.

## Increases in Capitalization.

Detroit, Mich.—Lavigne Mfg. Co. increases capital from \$100,000 to \$250,000.

St. Louis, Mo.—Carter Carburetter Co. increases its capital to \$36,000, fully paid in.

## Changes Among Prominent Tradesmen.

W. O. Rutherford, manager of the Buffalo branch of the B. F. Goodrich Co., is to become assistant to Vice-President H. E. Raymond at the company's plant in Akron, O. The change is to take place on July 15.

E. B. Finch has resigned as manager of the technical department of the Chalmers Motor Co., of Detroit, Mich., to become the distributor for Chalmers cars in Cleveland, O. He was tendered a dinner by his associates before his departure.

George Graham, who has been acting for the Overland interests in the Southwest, is to become assistant to John N. Willys, president of the Willys-Overland Co., of Toledo, O. The change will take place about the first of August, when Graham will move to Toledo.

Peter Fogarty, who was sales manager for George C. John, and who is one of the veterans of the Metropolitan trade, has become sales manager of the Croxton-Keeton Co. of New York City. The company now is handling the Inter-State car in addition to the Croxton-Keeton line.

H. J. Twelvetree has been appointed manager of the Cleveland branch of Thomas B. Jeffery & Co., succeeding George S. Patterson, who recently resigned to become general manager of the Gaeth Automobile Co., of Cleveland. Twelvetree has been assistant manager of the branch for some time.

## IN THE RETAIL WORLD.

John R. Davies of Lansford, Pa., has opened a garage on West Bertsch street. He will rent and repair cars and sell accessories.

The Salina Automobile Co., of Salina, Kan., has changed hands. A. J. Cleveland of Minneapolis, Kan., is the new owner; Fred Shellabarger has retired.

The Major Motor Car Co. has opened a garage and salesroom at 1512-1516 Locust street, St. Louis, Mo. The concern will represent Pennsylvania and Herreshoff cars.

W. H. Thayer, formerly of Pueblo, Colo., has become a partner of George W. Williams in the Araphoe Motor Co., in Denver, Colo. Elmore cars form their chief "stock in trade."

Under the style of the Tri-State Auto Co., a new concern has been established at 111-113 Central avenue, Minneapolis, Minn. Inter-State and Page-Detroit cars will be sold.

F. Byron Naylor of San Diego, Cal., is constructing a brick and concrete garage at the corner of Seventeenth and C streets. The building will be 100 feet square and cost \$15,000.

The Wagner-Kennedy Co. is the title of a new firm which has been formed in San Francisco, Cal. Its showrooms are on Van Ness avenue, near Bush street, where Marmion cars will be handled.

Under the style of the East End Automobile Co., a company has been formed in Mt. Pleasant, Pa. It will erect a garage in the rear of the East End hotel and do general repair work and renting.

Nine automobiles, a large amount of accessories, and equipment belonging to the local national guard company, were burned in a fire at Charles Echols' garage in Artesia, N. M. The loss exceeded \$25,000.

F. H. Grasswick, of Calgary, Alberta, Canada, has "taken on" the Haynes car, for which he has been given a considerable slice of territory. His agency includes all of Alberta and Western British Columbia.

R. M. Skidmore and Harry G. Hawkins have formed a new company under the style of the Washington Motor Vehicle Co., with showrooms at 508-510 Second avenue, Spokane, Wash. Baker electrics will be featured.

The three-story brick garage and a stable at Nos. 481 and 483 Park avenue, New York City, are to be made over into a garage for the Washington Irving estate, at a cost of \$12,000. M. Shulof and J. Bullinger are the lessees.

The Howard Cregor Co. has opened a garage and salesroom at 1207-1209 Broadway, Nashville, Tenn. Among the makes represented by the firm are Chalmers, Stearns and Hudson gasoline cars, and Detroit electrics.

The Jones Auto Exchange, the Ford agency, is about to move to more commodious quarters at 118-120 North Topeka avenue, Wichita, Kan. The new building is fitted in the most elaborate style with baths, restrooms, tinted walls and painted panels.

The Broadway Garage & Sales Co., of Kansas City, Mo., has opened a garage and salesroom at Broadway and Thirty-fourth street. R. B. Edwards, H. D. Biggs and Roy Bonebrake are the members of the new company, which will handle the Clark product.

R. G. Fernald is building a garage and salesroom, facing on Lincoln avenue, Denver, Colo., where he will open up shortly under the style of the Lincoln Automobile Co. The structure will be 50 x 125 feet, of brick and concrete. Westcott cars are to be featured.

The new three-story brick and stone garage building which has been erected at 220 Adams avenue, Scranton, Pa., was formally opened last week by the Electric City Auto Co., who will handle Ramblers, Regals and Hupmobiles. The building has a floor space of 40x100 square feet.

The Downer Place Garage Co., recently formed in Aurora, Ill., will occupy a new garage and salesroom which is being built at Downer place and Lake street. The building will cost, when complete, about \$30,000. Stearns, Oakland, Moon and Brush cars will be carried.

Leo and Edward Bigel, both of whom are connected with the Cincinnati Pump Co., have gone into the automobile business, and opened a salesroom at the manufacturing plant of the pump company at 109 East Liberty street, Cincinnati, Ohio. They will specialize in Selden cars.

J. King James, who was the first man to bring an automobile to Bristol, Tenn., and who for many years has conducted a garage there, has sold the business to Capt. David S. Simpson and several associates. The new owners will continue the garage under the style of the Bristol Automobile Co.

The West Side of Chicago is being invaded by automobile firms: the Rowe Automobile Co., at 281 West Lake street, and the Hagman Co., at Jackson boulevard and Hoyn avenue, being the first to "break in." The Rowe concern handles the Everitt "30," while the Hagman displays the Lambert car.

W. B. Sanford of the Tacoma (Wash.) Taxicab Co. has purchased the entire equipment and good will of the Washington Auto Machine shop at 705 Pacific avenue. He will make the machine shop his main garage and do a general garage and repair business, besides continuing his taxicab service.

The Lampl-Sternberg Auto Co. is the style of a new concern which has opened a

garage at 114-116 St. Francis avenue, Wichita, Kan. The building is two stories high, of brick and concrete, with steel ceilings and plate glass front. Studebaker, E-M-F, Flanders and National cars will be handled.

The Central Garage & Machine Works, at 238 West 50th street, New York City, N. Y., has made an assignment to Edwin A. Haaker. The corporation was incorporated on August 28, 1908, with capital stock of \$5,000, and conducted a school for chauffeurs besides doing general garage and repair business.

The Lee Motor Co., of Oklahoma City, Okla., has found its old quarters on West Main street too cramped, and is building a new garage and salesroom at 15 Broadway Circle. The new establishment, which is to be ready by August 1, will be three stories high and cover a ground area of 7,750 square feet.

Two dwelling houses, a garage and a big touring car were destroyed by fire in Oakland, Cal., on May 30th, when gasoline vapor from a leaking tank in the garage of N. J. Herby, 102 Ettie street, North Oakland, exploded while Herby was filling the tank. Before the fire could be checked it had caused over \$8,000 damages.

The Citizens' Motor Car Co., of Cincinnati, Ohio, is about to add five stories to its present garage at Main and 7th streets, at a cost of about \$73,000. This will make the building eight stories high, with a ground area of 137 x 93 feet. The additional stories are of reinforced concrete and will be built as nearly fire-proof as possible.

What is claimed as the largest garage building in the world is being built on the Grand Boulevard, west of Cass avenue, Detroit, Mich., by the Buick Auto Supply & Garage Co., of Saginaw, Mich. The building will be of brick and reinforced concrete, 245x150 feet, and comprise a garage free of posts, covering 245x100 feet, and a machine shop 50x100 feet, as well as offices, etc.

The large building extending from 19-21 West Sixty-second street to 18-20 West Sixty-third street, New York City, has been leased for the period of ten years for the Chalmers-Detroit Co., to the W. C. P. Taxicab Co. It was formerly occupied by the R. M. Stivers Co., carriage builders, and comprises a complete carriage factory, with a frontage of fifty feet in each of the two crosstown streets.

T. Eaton & Co., the largest retail mercantile house in the Dominion of Canada, have opened an automobile branch in Toronto. The automobile department, which is conducted entirely independently of the Eaton department stores, will occupy a five-story building, which just has been completed. T. Cotching is the manager of this department, which will handle Chalmers cars exclusively.

# WHITE GASOLINE CARS

## for 1911

**SIZE AND POWER**—moderate, therefore, most economical to maintain.

**PRICE**—moderate, therefore, easy to buy.

**DESIGN**—includes many advanced features not found in any other American car.

**QUALITY**—The only moderate sized car wherein every part is just as well built as in the highest-price, high-powered cars.

**DELIVERY**—Very few open dates. First come, first served.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, JUNE 9, 1910.

**Gaynor's New Declaration of "Rights."**

Mayor Gaynor has a reputation for irascibility and scant courtesy, but he generally is credited with being the possessor of a considerable fund of horse sense. His discourteous treatment of the automobilists who appeared before him in an effort to influence his disapproval of the bill which will practically convert a mid-section of the Coney Island Boulevard into a speedway for horse trotters, was, therefore, not wholly surprising, but his remarks and his reasons for approving the bill scarcely are worthy of one who only recently doffed the judicial ermine.

His assertion that "owners of automobiles are generally quite content" to be forced off the boulevard, "and that they deem it no more than just" is unwarranted by facts, while his declaration that those who oppose the bill are "too selfish to see the rights of others" is but one of many illustrations of his discourtesy.

It will be news to many persons that it is the "right" of any one class to have a mid-section of any public thoroughfare set aside for its own special purposes and to the exclusion of all other classes. But if this quasi-judicial declaration is correct, automobilists should lose no time in exercising their "right" by seeking to pre-empt a public highway for their uses; as, to paraphrase Mayor Gaynor, "there is no road in the Borough of Brooklyn (or anywhere else) where those who own and love automobiles may speed them." The howl that would arise and the virtuous indignation and wrath to which the sweet-tempered mayor would give vent were he asked to approve such a movement or measure are easily imagined. But if horsemen are "justly" entitled to such a speedway surely the same equal and exact justice entitles automobilists to one.

It generally is supposed that "the greatest good to the greatest number" is one of the keynotes of public policy, and if anything of the sort enters into a law that sets aside a portion of a public road for the uses of ten or a dozen horsemen and makes trespassers of a hundred or a thousand times as many motorists and cyclists, and subjects them to arrest, the mayor will perform a public service by pointing it out. It greatly is to be feared that the same political influence that reached the legislature reached into the mayor's office.

Mayor Gaynor's further assertion that "very much has been done for owners of automobiles" is in keeping with his other declarations. About all that has been done for them has been to force them to pay for the supposed right freely to use the public highways and generally to impose fees and fines and penalties and other burdens of which horse trotters never even dream.

**The Scope of the Engineer.**

So much flattery has been lavished on the automobile engineer by the daily newspapers in the course of tributes to his scientific attainments and praise for the products of his labors, and so much direct truth about the mad haste with which the industry is shaping itself has been uttered by those in a position to understand its growth, that there has come to be a certain indefiniteness about the real function of the automobile engineer. The question well might be asked, What does the automobile engi-

neer do for a living? Of course, the answer would vary according to the particular engineer or group of engineers that happened to be in mind. But it is safe to say that the average estimate of the real worth of the engineering department to the manufacturer would come as far out of the way as would that of the precise nature of its efforts and accomplishments.

It may be said without fear of contradiction that the time is past when the chief engineer is expected to develop entirely new and radical designs. Generally speaking, manufacturers of established standing are content to pursue a fairly uniform policy of design from year to year without demanding either very complete or very complicated changes in their products. It is true that in some instances very advanced designs are being studied, and that in a number of factories considerable time and energy is being devoted to the evolution of a satisfactory type of commercial vehicle. But in general, the burden of the engineer's work does not lie along the line of extensive constructive effort.

Nor is it true, as sometimes might be supposed, that the engineering department is engrossed to an overwhelming extent in the business of contriving manufacturing processes. The modern automobile engineer is neither a devoted inventor nor a highly technical sort of cost expert; rather he combines these two functions. At the same time he exercises vigilant supervision over every mechanical phase of the business, watching for opportunities to improve the product, reduce its cost or facilitate its manufacture.

It is in the routine work of the laboratory that the engineering department finds its most tangible opportunity for service, however. Every ounce of material which goes into the car must be up to specification and its properties must be proved according to recognized methods. The engineer first shows his hand in drawing the specifications after his general and tentative designs have gone the rounds and been approved. Once the material specifications are out and production has begun, there are questions of equipment to be decided which, in matters pertaining directly to his department, such as ignition, carburation, tires, bearings, and frequently parts as well, depend not a little upon actual laboratory tests for decision. Problems in valve setting, carburettor adjustment, ignition tim-

ing and lubricator regulation must be solved by extended dynamometer trials. In odd moments, the engineer is supposed to fill in his time by thinking up new ideas to be applied when opportunity offers; indeed, he is regarded as the general fountain-head of ideas from which any mental, moral, physical or technical stimulus may be tapped off at will by any other member of the organization who happens to be in need.

The modern engineer must be an extremely busy and purposeful person, ingenious and tirelessly resourceful. But he should not be regarded in the light of an inventive genius only. His greatest service to the industry at the present time—and it is a most important service indeed—consists in the application of his technical training to the translation of certain valuable ideals into the concrete expression of an intense commercialism, the commercialism of a whirlwind industry which demands results first and reasons afterward.

#### Perplexities of the Labor Problem.

More acute with automobile manufacturers than with almost any other line of production, the labor problem is the source of worry, perplexity, annoyance and a general wrinkling of brows, a condition which is aggravated by the "stealing" of employees which has developed as the result of the demand for men. Loud complaints are being voiced by manufacturers whose experienced workmen are being drawn from them by the lure of higher wages and greater opportunity elsewhere.

Youths who in some instances, it is alleged by "scouts" who are employed for the purpose, came into their shops a few years ago with little or no mechanical knowledge, and have been made into expert workers by careful training, are leaving in numbers to accept places in other motor car factories for more wages, and the manufacturers who lose them feel that the men exhibit a species of ingratitude in leaving, and that rivals who engage them are guilty of some vague violation of manufacturing ethics; and at the same time the manufacturers who are paying the advanced wages are not at all happy that they must give high figures and are rather envious of the makers who can "grow" their own workmen.

In just the sense that the heavy demand for cars keeps up profits, the corresponding demand for workmen to make them must

have its effect in keeping wages up, but that there may be a false and extravagant basis for hiring men away from other makers is apparent. The jovial searcher for men who invites them down to the hotel, orders fancy drinks and unfolds visions of not only higher wages but a flattering future is not apt to err on the side of conservatism. His absolute figures as to wages are definite enough, but his accompanying pictures of advancement and personal prosperity for the men he tries to win, are sufficiently vague to permit full play to his imagination and zeal in "delivering the goods" to his employers.

It is because of the idea that some of the companies most active in acquiring men from other factories are going about it in a way not justified by the economic conditions governing the case and are giving wage figures and promises which time will prove to be false in respect to permanent manufacturing, that the makers who are losing men are more or less vengeful and are contemplating such reprisals as lie in their power. They object to having their factories made mere training schools for supplying the emergency needs of automobile factories where abrupt developments and expansions are conducted with the offering of "fancy" wages to get the necessary men.

From the standpoint of the workers, the situation has its benefits, perhaps more so for those who remain with the factories where they received their training than for those who yield readily to the offers of outsiders. Defections in the working force, for pastures new, mean an increased appreciation for those who remain and also gives them greater individual opportunities of advancement.

It is contended rightly by the manufacturers, however, that the proper solution of the labor problem is not in the makers hiring men away from each other in a circle of constant advances and premiums in wages, but in making proper provision for training the number of men necessary for the full equipment of the industry. There is danger to the workman himself if he go to a new factory at a wage which later may lead to his being discharged in order that the wage scale may be readjusted to a more normal level. This result is only too probable when the temporary stress of expansion is over and makers in general have time to provide for the training of their own men from green material.

## COMING EVENTS

June 6-14, New York Herald-Atlanta Journal second annual good roads tour.

June 11, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hillclimb on Giant's Despair.

June 14-15, New York City—Motor Contest Association's biennial "Around Long Island" reliability run.

June 14-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

June 17-18, Buffalo, N. Y.—Automobile races at Fort Erie track.

June 18, Baltimore, Md.—Automobile Club of Maryland's hillclimb.

June 18, Ossining, N. Y.—Upper Westchester Automobile Club's annual hillclimb.

June 18, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

June 28-30, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' Association's endurance run for "Star" trophy.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

July 13, Winnipeg, Man.—Winnipeg Automobile Club-Winnipeg Motor Trades Association joint racemeet.

July 18-22, Milwaukee, Wis.—Wisconsin Automobile Association's first annual endurance test for "Milwaukee Sentinel" trophy.

July 30, Wildwood, N. J.—North Wildwood Automobile Club's race meet on Wildwood Speedway.

August 3-5, Galveston, Tex.—Galveston Automobile Club's beach races.

August 6, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

**DEAD HORSE CLIMB NOT SO LIVELY**

Scarcity of Competitors Detracts from its Importance—Caleb Bragg, the "Amateur," Makes the Fastest Flight.

Due to lack of entries and slower time than has been recorded in previous years,

on a drum driven at constant speed by a small motor and on which are indicated second intervals through an electrically connected clock and pendulum. The speed of the paper can be regulated to record any fractions of a second. The instant a car goes over the line, either start or finish, the circuit is opened and the progress

car, the number of the event and the driver, and this system installed in duplicate, so that each performance is certified beyond possibility of question. This unique apparatus also can be arranged so that a series of gongs placed at different positions along the course will announce to the spectators the exact time of the start and the finish of a car.

Insofar as the meet itself was concerned there was little of the spectacular to require many glowing adjectives. The meet was opened by four motorcycle events, two of which had more than one contestant,

LOVEJOY (JACKSON) ON AN EASY PART OF THE SLOPE

THE TIMING APPARATUS

the annual hill climbing fest promoted by the Worcester (Mass.) Automobile Club, and held on the Dead Horse hill near that city, Saturday last, 4th inst., truthfully cannot be said to have been up to the previous standard, although the Worcester people would have it so. The crowd was smaller than has prevailed at former contests, numbering only about 5,000, and a very small percentage of these went to the top of the hill.

The record for the hill—54 seconds—was made a year ago by L. F. Baldwin, and in Saturday's meet the nearest approach to this was made by Caleb Bragg, whose Fiat covered the mile uphill course in 58 seconds flat. The same car which made the record twelve months ago could do no better than 1:09 1-10 last Saturday.

Perhaps the most interesting feature of the meet was the timing apparatus designed and operated by split-second "sharps" of the Worcester Polytechnic Institute, which successfully was tried out for the first time in a big event. This electrical apparatus, which can be made to record to the 1-1000th part of a second, but which on Saturday was made only to register tenths of seconds, as the scarcity of starters made more accurate timing unnecessary, is unique in arrangement. It consists of a roll of paper

KINGSLEY (THOMAS) RUSHING A STEEP PITCH

of the car recorded on the tape until the other wire closes the circuit. Each tape is marked with the make and number of the

and B. A. Swenson, of Providence, furnished all the excitement. He rode a two cylinder Indian motorcycle to the top in 1 minute

3 seconds, which was considerably faster than a great many of the cars were able to accomplish.

The Dead Horse hill, according to survey, is exactly one mile in length and the first quarter mile rises to 10.3 per cent. and then eases away to 8.3 per cent. The steepest portion is in the second quarter, when it reaches 12.2 per cent., the last half mile having an average rise of 8.8 per cent.

With only one car in five of the nine automobile events it follows that the excitement occasioned by the running of these classes was not of the nature to bring any attacks of heart failure to any of the lookers-on. J. F. Kingsley and his Thomas car had a walkover in the class for cars listing at \$4,000 and over, as did R. H. Higgins, Elmer Knox and Albert White, in their respective classes, while there was only one entrant also in the electric class. Lovejoy in a Jackson won the \$1,601 to \$2,000 class in 1:10 9-10, and later bettered this performance in the free-for-all.

The only two thrills of a thrilless meet came in the free-for-all—the last event on the program. Caleb Bragg, the A. A. A. "amateur," went up so fast that he appeared to be driving recklessly, and his snorting leviathan brought out a few cheers, followed by another burst of applause when it was announced that his time was 58 seconds. It proved to be the best performance of the day. The next fastest flight was made by Harry Grant, the famous Alco pilot and Vanderbilt cup race winner. Grant's time was 1:02. Lovejoy, who followed, was timed in 1:08 8-10. The summary:

#### \$4,000 and Over.

1 J. J. Kingsley, Thomas.....1:06 4-10

#### \$3,001 to \$4,000.

1 R. H. Higgins, Stearns.....1:53

#### \$2,001 to \$3,000.

1 Elmer Knox, Atlas.....1:31 2-10

#### \$1,601 to \$2,000.

1 R. M. Lovejoy, Jackson.....1:10 9-10

2 Howard E. Bauer, Oakland.....1:30 8-10

#### \$1,201 to \$1,600.

1 F. F. Cameron, Cameron.....1:38 6-10

2 Edw. Ditteau, Parry.....1:56 7-10

#### \$801 to \$1,200.

#### Miss Hess Makes Two Proposals.

If there is any automobile manufacturer who desires to prove to the world that it is possible for a woman not merely to drive his car across the continent, or anywhere

MISS VENICE A. HESS

else, but absolutely to take care of it under any and all conditions and without assistance from any man, there is a young woman in Pasadena, Cal., who is both ready and anxious to demonstrate her ability to fill the bill. She is Miss Venice A. Hess, whose business card shows that she conducts an automobile rental service in Pasadena, and who unfolds her ideas in the following letter to the Motor World:

"As you are connected with all the motor people, I am writing you this proposition, because you may be able to set me aright; if you are interested in the motor world for woman as well as man.

"I am a girl just over nineteen, very anxious and ambitious; I have been driving autos for the past eight years, and taken care of them myself. I have now a sixty horsepower Thomas, and a fourteen horsepower car that I have built of parts of other cars.

"No. 1—With the right people or company I will sign a contract to take any standard gas car which has been assembled and tested, let them disassemble that car, ship the parts here, and I will assemble same and cross the continent with it, and

no one touch the mechanism but myself. Of course, when help is needed to hold a thing, that is different, or a part should break and need a new part, for I don't mean to make parts, though I can operate a lathe, drill, etc. They can have a man over me from beginning until ending to see that I do it myself.

"No. 2—Or I will take any car, let them take a part out, so that the car is useless and I will find that part which is out of order or taken away, and put it in place again so that the car will run as good as ever.

"I have the ability and knowledge and strength, and will contest in anything with man or woman. Some motor company may want to show how simple their car is built by such a contest as No. 1 above."

#### New York Orphans Have their Outing.

Through the generosity of the New York automobile trade and allied interests and private individuals, who responded to appeals for cars more generously than ever before, some 3,300 orphans were enabled to participate in the sixth annual outing at Coney Island on Thursday last, 2d inst., which was given under the auspices of the Orphans' Automobile Day Association, which is composed largely of prominent tradesmen. There were over 300 cars in line, and all were loaded to the guards with the little waifs of the orphan asylums of Manhattan and Brooklyn, whose calendar reckonings are computed from the day of days when once a year they are given the freedom of the gay city by the sea, through the courtesy of the management. Hugh Chalmers, president of the Chalmers Motor Co., Detroit, Mich., provided luncheon, to which the kiddies sat down immediately upon their arrival at Coney Island shortly after noon. After four hours of pleasure and recreation the start for home was made. The only mishap occurred in Brooklyn on the return, when a 'bus was run into and a few children bruised.

#### Mr. Munsey to Repeat his "Function."

Frank A. Munsey, the publisher, will "repeat" this year. Having conducted a polite form of endurance contest last year, the management of the chain of newspapers which bear Mr. Munsey's name has decided to try again, with variations. Accordingly this year's event, which is to start from Philadelphia on August 15th, is to be known as the Munsey Historical tour. The explanation is that the route will be laid through a number of points which are mentioned in the standard textbooks as possessing valued associations. Two groups of contestants will be recognized, one of which will be composed of manufacturers and one of private owners. The rules of the American Automobile Association will be followed and the course, of some 1,600 or 1,700 miles, will lead as far north as Portland, Me., returning by a different way to Washington.

**READY FOR THE GLIDDEN CONTEST**

**Thirty Competitors to Start on Tuesday**  
**Next—Who They are and the Route**  
**They will Follow.**

With just as many contestants as started last year, the 7th annual tour of the American Automobile Association, which is the 6th annual contest for the Glidden and the first for the Chicago trophies, will begin on Tuesday morning next, June 14th. It will be the longest of the Glidden contests, the total distance being 2,851 miles, as against 2,636.8 miles last year.

The contest will start from Cincinnati,

Okl.; Friday, June 24—Lawton to Oklahoma City, Okla.; Saturday, June 25—Oklahoma City to Wichita, Kan.; Monday, June 27—Wichita to Kansas City, Kan.; Tuesday, June 28—Kansas City to Omaha, Neb.; Wednesday, June 29—Omaha to Des Moines, Iowa; Thursday, June 30—Des Moines to Davenport, Iowa; Friday, July 1—Davenport to Chicago, Ill. Sunday, June 19 and 26, will be days of rest.

There are 18 entries in the Glidden trophy division, two more than was the case last year, but for the first time, the Pierce-Arrow, the trophy holder, is not represented. The entrants with their numbers are as follows: 1, Premier Motor Mfg. Co.; 2, Premier Motor Mfg. Co.; 3, Chalmers Motor Co.; 4, Chalmers Motor Co.; 5, Chal-

Besides the contesting cars the other machines in the run are a Columbia, which will carry Referee Whiting and set the pace; a Reo, which will convey the tour secretary; a Chalmers, with the pilot, while the newspaper men will be carried in two Cuttings, a Maxwell and a Chalmers. The non-contesting cars which will follow the tourists are two Cadillacs, which have been fitted as gun carriages by the Northwestern Military Academy, and a Rapid truck.

**Elgin Prepares for a Speed Carnival.**

For the purpose of financing the road race which the Chicago Motor Club is organizing, the Elgin Automobile Racing Association has been incorporated and in slack moments when it is not disposing of its \$20,000 stock issue, is arranging for a course for the two days' meet. By arrangement with the Chicago club, the latter body is securing entries and framing the program. Friday and Saturday, August 26th and 27th, have been named as the dates for the contest, to be held over an 8½ miles course.

The Chicago Motor Club, which is the real promoter of the event, has guaranteed a large entry list and magnificent profits to the Elginites, the benefits derivable from such an affair having been illustrated in some of the local newspapers by references to past performances at Lowell, Mass. A \$1,500 Elgin cup is to be the chief award, in addition to which there will be a substantial list of cash prizes. The officers chosen for the newly incorporated Elgin Automobile Racing Association are: Fred W. Jencks, president; Theodore Schmitz, vice-president; W. C. Wilson, secretary; Phillip Freiler, treasurer.

**Building Huge Grandstand at Indianapolis.**

Profiting by the lesson learned at the Decoration Day meet, when thousands were unable to obtain seats in the stands and overflowed into the paddock, the management of the Indianapolis (Ind.) Motor Speedway is taking steps to accommodate all future crowds by commencing work on a grandstand which will be one-half mile long, the largest structure of its kind in the world. The addition will be 1,840 feet in length, and will be coupled to the present structure, which is 800 feet long. Work will be begun at once, and the new stand is expected to be ready for the meeting in July. When completed the seating capacity, which at present is 40,000, will be doubled.

**California's Big Road Race Assured.**

The Portola road race, which is to California what the Fairmount Park classic is to Philadelphia, is again assured for this year, permission having been granted by the park commissioners of San Francisco to the Automobile Club of California to use the roads of Golden Gate park for the race. With this last serious obstacle removed, preparations are going forward and a tentative date, Sept. 10, has been selected.

MAP SHOWING ROUTE OF THE GLIDDEN TOUR

Ohio, and 16 days of traveling finally will bring the tourists to Chicago. Practically all the competing cars already are in Cincinnati, where they have been examined by the Contest Board's technical committee, to ascertain if they comply in all respects to the stock car definition. A. G. Whiting, of the Automobile Club of America, has been selected as referee, and Chairman S. M. Butler will be assisted by A. L. McMurry, E. L. Ferguson and David Beecroft. The itinerary is as follows:

Tuesday, June 14—Cincinnati, Ohio, to Louisville, Ky.; Wednesday, June 15—Louisville to Nashville, Tenn.; Thursday, June 16—Nashville, to Sheffield, Ala.; Friday, June 17—Sheffield to Memphis, Tenn.; Saturday, June 18—Memphis to Little Rock, Ark.; Monday, June 20—Little Rock to Hot Springs, Ark.; Tuesday, June 21—Hot Springs to Texarkana, Tex.; Wednesday, June 22—Texarkana to Dallas, Tex.; Thursday, June 23—Dallas to Lawton,

mers Motor Co.; 6, Cole Motor Car Co.; 7, Maxwell-Briscoe Motor Co.; 8, Cartecar Company; 9, Parry Auto Co.; 10, Bartholomew Company; 11, Ohio Motor Car Co.; 12, Ohio Motor Car Co.; 14, Penn. Auto. Motor Co.; 15, Cino (Haberer & Co.); 16, Buick Motor Co.; 17, Buick Motor Co.; 18, Oakland Motor Car Co.; 19, Oakland Motor Car Co.

There are 12 entrants in the Chicago trophy division, which is for miniature tonneaus and runabouts, corresponding to the Hower trophy class of previous contests, this number being two less than last year. The entrants are: 100, Moline Auto. Co.; 101, Moline Auto Co.; 102, Moline Auto Co.; 103, Lexington Motor Car Co. (John C. Moore); 104, Cole Motor Car Co.; 105, Parry Auto Company; 106, Fal Motor Car Co.; 107, Maxwell-Briscoe Motor Co.; 108, Cartecar Company; 109, Cartecar Company; 110, Lexington Motor Car Co.; 111, Westcott Automobile Co.

## SOUTHERNERS START FOR NEW YORK

**Second Good Roads Tour Sets Out from Atlanta over Proposed National Highway—Encouraged en Route.**

Escorted to the outskirts of this city by a detachment of mounted police, the second good roads tour promoted jointly by the New York Herald and Atlanta (Ga.) Journal over the proposed national highway between those two cities, started from the southern metropolis on Monday morning last, 6th inst., with 70 cars in line, 62 of them contestants in the 1,100 miles publicity jaunt in the interest of the promoting papers and which will end at Herald square, New York, on Tuesday, 14th. On the occasion of the first tour last fall, New York had the honor of giving the tourists a hearty sendoff, and this year Atlanta was accorded the privilege of launching the cavalcade, Mayor Maddox firing the starting gun and wishing each party good luck in true "Southern style" as they rolled past his stand.

Immense crowds from Atlanta and the surrounding territory lined the streets and cheered enthusiastically as the tourists got under way, while a band on a huge motor truck, which formed part of the farewell escort, struck up the air of "Dixie" and factory whistles and sirens screamed their hoarse adieus. In the early morning it appeared as if the skies would weep at the departure of so many native sons and dollars for Yankee land, many of the latter at least never to return, but later the sun came out and smiled his prettiest as the well loaded cars started on their long journey. In numbers this tour eclipses that of last year by about a dozen, exclusive of the eight official machines which make a small caravan in themselves.

Equally enthusiastic were the ovations tendered to the tourists after leaving Atlanta, on the run to Anderson, S. C., 139 miles and the first night stop on the tour. Factory, train and mill whistles screeched a welcome at every station and hamlet, while long lanes of people lined the highways and cheered themselves hoarse as the motorists flitted past. At Norcross, Ga., citizens stretched across the highway at the town limits a huge sign reading "Speed limit 110 miles," and which could be distinguished nearly a mile away. Furthermore, the smooth and excellent highways of this town easily were capable of the best speed which the cars could develop. On crossing Knox's Bridge, the boundary line between Georgia and South Carolina, the tourists passed beneath a huge floral arch, while further on pretty young maidens passed out post cards and refreshments to those who had time to tarry for a moment.

Several cars were penalized for late arrival at Anderson, some not reporting until nearly midnight. Some of the chief mishaps of the first day were broken springs which occurred to the Maxwells driven by Emmett Callan and Charles T. Smith. John W. Grant's Locomobile skidded into a ditch 4 miles from Atlanta and sustained a broken spring and wheel, which latter were replaced. The second day's run was to Charlotte, N. C., 159 miles. The contestants and their cars are as follows:

Packard, Beaumont Davison, Atlanta, Ga.  
National, W. J. Stoddard, Atlanta, Ga.  
Thomas, Col. John J. Woodside, Atlanta, Ga.  
Packard, Robert E. O'Donnely, Atlanta, Ga.  
Knox, Joseph F. Gatins, Jr., Atlanta, Ga.  
Pope-Toledo, Edward M. Durant, Atlanta, Ga.  
Lambert, W. S. McNeal, Jr., Atlanta, Ga.  
Regal, Regal Atlanta branch, Atlanta, Ga.  
Lambert, J. T. McNinch, Atlanta, Ga.  
White Star, White Star Co., Atlanta, Ga.  
American Traveler, Jackson P. Dick, Atlanta, Ga.  
Maxwell, Maxwell-Briscoe Motor Co., New York.  
Pope-Hartford, E. H. Inman, Atlanta, Ga.  
Maxwell, C. W. DuPre, Marietta, Ga.  
Columbia, Charles I. Ryan, Atlanta, Ga.  
Buick, W. E. Wimpy, Atlanta, Ga.  
Chalmers, J. H. Marsteller, Roanoke, Va.  
Ford, E. M. Willingham, Atlanta, Ga.  
Hupmobile, N. W. Wallace, Jr., Charlotte, N. C.  
Pope-Hartford, Milt Saul, Atlanta, Ga.  
Hudson, Ralph W. Northcutt, Marietta, Ga.  
Brush, Georgia Brush Auto Co., Atlanta, Ga.  
Kisselkar, Kelley-Knight Motor Car Co., Atlanta, Ga.  
Speedwell, Arthur T. Smart, Atlanta, Ga.  
Firestone-Columbus, Columbus Buggy Co., Columbus, O.  
Stoddard-Dayton, W. D. Alexander, Atlanta, Ga.  
Lozier, Asa G. Candler, Jr., Atlanta, Ga.  
Maxwell, Maxwell-Briscoe-Southern Co., Atlanta, Ga.  
Locomobile, John W. Grant, Atlanta, Ga.  
Hupmobile, E. D. Crane & Co., Atlanta, Ga.  
Corbin, T. H. Cooper, Salem, Va.  
Stevens-Duryea, C. H. Johnson, Atlanta, Ga.  
Halladay, Georgia Commission Co., Albany, Ga.  
Brush, John Moore & Co., New York.  
Winton, Herman J. Haas, Atlanta, Ga.  
Selden, J. E. Brown, Atlanta, Ga.  
Speedwell, S. M. Smith, Bluefield, W. Va.  
Ford, Dr. E. C. Seawright, Fayetteville, Ga.  
Jackson, C. D. Smith, Albany, Ga.  
Maxwell, Julian H. Reynolds, Augusta, Ga.  
Mitchell, L. C. Brown, Athens, Ga.  
Thomas, Roy Collier, Atlanta, Ga.  
Mercer, Mercer Motor Car Co., Trenton, N. J.  
Pullman, W. G. Humphrey, Atlanta, Ga.  
Ohio, Ohio Motor Car Co., Cincinnati, O.  
Pullman, Pullman Motor Car Co., York, Pa.  
Cole, Carter and Logan Bros., Savannah, Ga.  
Reo, A. P. Herrington, Atlanta, Ga.  
Oakland, Robert Campbell, Cedartown, Ga.  
Cadillac, D. K. McColl, Barnetsville, S. C.

Ohio, M. L. Thrower, Atlanta, Ga.  
Columbia, Marcellus Rambo, Birmingham, Ala.  
Mitchell, Winston-Salem Good Roads Committee, Winston, N. C.  
Palmer-Singer, R. D. Apperson, Lynchburg, Va.  
E-M-F., R. G. Scruggs, Waycross, Ga.  
White, W. A. Gunter, Montgomery, Ala.  
Cadillac, W. H. Peacock, Cochran, Ga.  
Stevens-Duryea, Mrs. Myrtle L. Barnes, Myrtle, Ala.  
Buick, Lamar S. Collier, Atlanta, Ga.  
Maxwell, Charles T. Smith, Concord, Ga.  
Maxwell, Emmett Callan, Washington, Ga.  
Columbia, J. W. Mangham, Griffin, Ga.

### Swiss to Open Their Highways.

According to advices received from its Paris branch by the Pierce-Arrow Motor Car Co., Switzerland has come to the conclusion that it is to its interest to encourage motor car tourists. For several years that country has had barriers against motor cars in the form of special taxes, closed roads and legislative restrictions of various kinds. The result has been that many tourists have shunned the country altogether, skirting the borders of the mountainous little republic by taking the roads along the Italian, Austria and German frontiers. Switzerland is noted for the large number of its hotels, and when the keepers of these resorts began to realize the amount of money that might have come into their hands from the tourists, but didn't, they became active.

The result of their activity, the Pierce-Arrow advices state, is that the Swiss Federal Council will reopen the question of allowing cars on the roads in the Canton of Grisons, which includes within its confines some of the best thoroughfares through the picturesque passes of the Alps, among them main arteries leading to Germany and Italy. A trial is to be made of practically unrestricted travel in the Grisons district, and the question of opening the roads in other districts is to be entertained.

### Olds Owners to Meet Once More.

Invitations have been issued by Gen. J. T. Cutting for the sixth annual reunion of Oldsmobile owners in the East, which will be held at the Empire City track, Yonkers, N. Y., on Saturday, 11th inst., and which was the trysting place of the first gathering. As in former years, a \$3,000 Olds will be given away in a drawing, in which only Olds owners may participate, and a program of speed trials and novelty events will be decided.

### Here's Another Wonderful Tire Record.

California has produced another wonderful tire record. Allen R. Kennedy, of San Jose, has made affidavit that on one set of Diamond tires—36 x 4 front, 36 x 5 rear—he has traveled 27,000 miles. The tires were applied to a 4,000 pound car and Kennedy swears that they were removed from the wheels on but two occasions, when the valves of two inner tubes required repair.

**BRAGG NOT QUITE FAST ENOUGH**

**His College Chums See "Prof." Robertson Show Him How to Climb Shingle Hill—Honors Well Distributed.**

Almost as great a calamity in the eyes of Yale men and New Haveners generally as would be the triumph of the Harvard hosts over the Sons of Eli on their own gridiron, was the defeat of Caleb Bragg, the "millionaire amateur" driver of the Fiat forces, and himself a Yale graduate, by smiling George Robertson and his well nigh invincible Simplex in the free-for-all class at the Yale University Automobile Club's third annual climb on Shingle hill, West Haven, Conn., on Tuesday afternoon, 7th inst. Although he did not lower the course record of 51 seconds, made by David Bruce-Brown last year, Robertson came mighty close to it and pushed the big Simplex to the top in 51½ seconds.

Bragg, who, fresh from his triumph at Dead Horse hill, Worcester, last week, was the universal favorite in the stellar event, disappointed his admirers who looked to see him add to his laurels in the city of his alma mater and in an event promoted by a club which in his college days he had helped to organize. Starting just before Robertson, Bragg made an excellent climb in the big Fiat "90," but the time, 52½ seconds, was a disappointment, as it failed to shatter Bruce-Brown's figures. Greater humiliation was administered to the "amateur" a few moments later, when Robertson got under his figures and carried off the laurels of the day.

New England built cars showed up well in the stock events, capturing two out of five. Joseph Taylor, who drove a Correja to victory in its maiden appearance at Bridgeport, on Decoration Day, duplicated the feat in the \$1,600 class, which he won by a good margin. Time, 1:13. E. C. Bull, Buick, who ran second to Taylor in the previous class, retrieved himself by winning the \$2,000 division in 1:14. Fred Belcher, who placed a Knox third in the all star division, gained further laurels by winning the \$3,000 class in 1:06, defeating Billy Knipper, Chalmers, by 4 seconds. However, Belcher's victory afterwards was protested by Maynard, entrant of Knipper's Chalmers, on the ground that the Knox was ineligible because of non-compliance with the rules. Referee Gillette will render a decision in the matter later.

T. Jones, at the wheel of an Amplex, carried off the honors in the \$3,000-\$4,000 category by the narrow margin of ⅔ of a second. He was timed in 1:09½, and Pallman, P-S, did it in 1:09¾. There were but three starters in the high-priced division for cars costing over \$4,000, and the pair of Houpt-

Rockwells from Bristol ran 1, 3, Frank Ives driving the winner in 1:07¾. R. B. Stern, in a Simplex, was second. Quite spectacular were the three motorcycle events, and it was in these that the fastest time of the day, 51½ seconds, was made. Merkel machines made a triple killing and H. H. Logan, a Yale student, rode the winner in two events. His time in the twin class was 53¾ seconds, which he bettered by 2 seconds in the free-for-all. A. G. Chapple won the single cylinder event in 54¾ seconds.

Owing to the prominence of the drivers, and the expectations of thrilling stunts on the "S" turn, the contest attracted a crowd of nearly 7,000, hundreds of whom came in motor cars. Parking spaces along the route were well taken, particularly at the well adapted action points, where standing room was at a premium. Especially was this so at the "S" turn, where the largest crowd congregated. Many of the agile ones, unable to obtain satisfactory places on the ground, climbed into the trees along the course in order the better to witness the flights. The ideal weather which followed the recent rains, together with the grooming which the course received, left it in prime shape for the climb. Not a single mishap occurred.

The results follow:

**Class D—Under \$1,600.**

Drivers and Cars.	Time.
Joseph Taylor, Correja.....	1:13
E. C. Bull, Buick.....	1:18½

**SWAN FLIES UP BLACKSTRAP HILL**

**Takes Three Firsts with an Intermission for**

**Dinner—Slow Climb on High Gear Proves Novel Event.**

Favored with a perfect course, ideal weather, well filled classes and close competition, the hill climbing contest on Blackstrap hill, West Falmouth, a suburb of Portland, Me., on Saturday last, 4th inst., promoted by the Portland Sunday Telegram, left nothing to be desired. Nearly 6,000 people from far and near viewed the flights from advantageous positions along the course.

There were seven events and all but one were well filled, but the honors were somewhat unequally divided, R. P. Swan capturing three of the seven firsts. In the free-for-all class, the feature of the card, Swan in addition to winning the event made the fastest time of the day, 1:17¼. Second place in this class resulted in a tie between A. M. Spear, Ford, and A. T. Baker, Thomas, both of whom swept up the nine-tenths of a mile straightaway in 1:20 flat. In the intermediate classes, while the starters were somewhat sparse, the struggles were exciting and in some cases close, the winners being Swan, Buick; Willard, Inter-State, and Frost, Palmer-Singer. Nearly all of the starters in the previous events faced the gun in the free-for-all. Baker in the Thomas was the first sent away and set the figures at 1:20, which were equalled by the next man, Spear in the Ford. Further assaults against Father Time were unsuccessful until Swan made his bid, when the figures were hammered down to 1:17¼, where they remained.

The speed classes dispatched, the last number on the card was a slow race on high gear, which attracted seven starters, of whom Spear in the Ford proved the best manipulator of spark and throttle and used up 6 minutes 57 seconds on the incline. The next best at time killing was Roscoe Willard, who held an Inter-State down to 6:52¾. Arthur Brunt, Johnson, was third, with 6:49.

Departing somewhat from the usual order of things, the climb was run in double header fashion, an intermission of an hour and a half being taken after the fourth class was finished. Evidently the Down Easterners do not believe in letting sports interfere with their regular dinner hour. Typical of the shrewd New Englander, the ladies of a church society which bordered on the course, took advantage of the gathering to serve dinner to the hungry ones and incidentally swell the society's exchequer, and through their worthy efforts over \$100 was gathered in by catering to the wants of the inner man.

The timing was by electrical apparatus, the cars breaking strings stretched across the road at the start and finish, and which rang bells and recorded the time at either end. Not a hitch occurred in this department. The road was perfectly straight and as smooth as a billiard table, and had a steady rising grade which tested the best efforts of the motors.

Not a formal protest was made, and in order to preclude the possibility of adulterated fuel being used, samples were taken from each tank by a chemist and examined. However, at the request of A. M. Spear, Jr., a second sample was taken from the Buick car, which won Class B, and the award will be withheld pending the chemical analysis.

Following are the results:

Class A.	
Drivers and Cars.	Time.
C. E. Woodbury, Hupmobile.....	2:47

Class B.	
R. P. Swan, Buick.....	1:27
Charles Hill, Ford.....	1:34½
A. M. Spear, Jr., Ford.....	1:37
M. S. Folkins, Maxwell.....	1:45
Arthur Brunt, Johnson.....	1:53
P. T. Stoughton, Oakland.....	1:59

Class C.	
Roscoe Willard, Inter-State.....	1:31¾
James Meader, Oakland.....	1:32¾

Class C, Special.	
R. P. Swan, Buick.....	1:19¾
Arthur Brunt, Speedwell.....	1:38

Class E.	
Percy Frost, Palmer-Singer.....	1:22¾
A. T. Baker, Thomas.....	1:30

Free-for-All.	
R. P. Swan, Buick.....	1:17¾
A. T. Baker, Thomas.....	1:20
A. M. Spear, Jr., Ford.....	1:20
Norman Gray, Speedwell.....	1:23¾
Carroll Brown, Palmer-Singer.....	1:26¾
Charles Hill, Ford.....	1:28

Slow Race on High Gear.	
A. M. Spear, Jr., Ford.....	6:57
Roscoe Willard, Inter-State.....	6:52¾
Arthur Brunt, Johnson.....	6:49
R. P. Swan, Buick.....	6:37¾
Charles Hill, Ford.....	6:18
P. T. Stoughton, Oakland.....	5:25
M. S. Folkins, Maxwell.....	4:42¾

#### Not to Race Against Motor Cars Again.

Races between automobiles and railroad trains more often result unfortunately for the motorists than for the locomotive engineers, but at least one engineer has found it otherwise so far as his personal experience is concerned. As the result of speeding his train to a pace faster than was provided for on his schedule, in order to keep up with a motor car that was trying to beat him into Wichita, Kan., the man in charge of a Santa Fe Railroad locomotive was fined \$10 by the company. Two more such fines will entail his discharge, so that it is not likely that he will be tempted to further "brushes" with speeding motorists who are anxious to try conclusions with the iron horse.

## GOOD BEGINNING, POOR ENDING

**San Francisco's First Day Succeeded by a "Frost"—No Aviators; no Crowd; but Some Good Racing.**

If the San Francisco (Cal.) Motor Club's two days' meet at Tanforan track on May 29th and 30th had been a one day affair instead of a double header it is probable that the good roads cause to which the proceeds were devoted, would have fared better, for the first day's profits were changed to losses on the second. In the belief that a mixed program would attract larger crowds than a straight racing card, the club, which worked hard to make the meet a success, put on several aviation exhibitions by local bird men, and while this added feature helped to draw a crowd of between 5,000 and 6,000 on Sunday, the second day practically was a frost, both from an attendance and sporting standpoint, several of the star numbers being called off. On the whole the meet was not a financial success, and the club now faces a deficit instead of the expected fund which it hoped to raise.

#### First Day—Sunday, 29th.

With a \$100 side bet hinging on the result, the 5 miles stock chassis race for cars under 230 cubic inches was a pretty struggle between Ruddle in the Ford and Murray, Buick, who were the only starters. Ruddle got the pole early and held it throughout, despite the efforts of Murray to wrest it from him. Coming down the stretch for the last time the cars were almost abreast, but Ruddle crossed the wire first by a margin of 2 seconds. The time, 4:36¾. Although the contesting cars were much more powerful, the time in the 5 miles for stock chassis, 231-450 class, was much slower than its predecessor, but nevertheless proved the most exciting race of the day. As in the previous race there were only two starters, Murray, Buick, and Bert Oakes, Knox. Both evidently understood the desirability of furnishing some excitement and drove accordingly. It was more like a game of tag than a race, the two alternating in the lead with the other at his heels. The fourth lap was a dead heat, and the expected break came in the stretch when Murray crawled ahead a few feet and led Oakes to the wire by a fifth of a second amid great enthusiasm. The time was 5:58¾.

In the 10 miles handicap Murray, who was scratch, gave Ruddle in the Ford a minute start, which proved all too ample, though the scratch man made desperate efforts to make up the gap. Ruddle never was in danger of losing and romped home an easy winner in 11:16¾. The best mile

of the day was made by Murray, who covered the last lap in 0:59¾. Those old rivals, Balke and Collins, furnished the excitement in the motorcycle events, and broke even, each taking one race. Balke, steering a Thor, won the 5 miles for twins in 4:56.02, and Collins, on an Indian, captured the 5 miles coast championship for twins in 4:52¾.

The summaries:

Five miles stock chassis, 230 cubic inches and under—Won by A. Ruddle, Ford; second, Frank Murray, Buick. Time, 4:36¾.

Five miles stock chassis, 231-450 cubic inches—Won by Murray, Buick; second, Bert Oakes, Knox. Time, 5:58¾.

Ten miles handicap—Won by Ruddle, Ford (1.00); second, Murray, Buick (scratch). Time, 11:16¾.

#### Second Day—Monday, 30th.

Everything seemed to go awry on Monday, the aviation trials being given up on account of accidents to the air birds, and the automobile events had a sameness and lack of entrants which sent the enthusiasm below par. From the hammer and tongs fashion in which it was begun the five miles race between Murray and Oakes, handling a Buick and Knox respectively, promised to be a lively seance, but it fizzled early, Oakes stopping in the third mile and Murray romped home a winner in 5:50¾. Later these two came together again at the same distance, and Murray duplicated his previous performance, but not by such a big margin, Oakes putting up more opposition. The time, 6:02¾. Three started in the 10 miles open, Murray, Ruddle and Schuler, Autocar, and this furnished the best racing of the day. Schuler went to the front early and managed to stay there despite the efforts of Ruddle to displace him, while Murray never proved dangerous. Schuler's time was 11:18¾; Ruddle was second. Murray captured the closing event, a 5 miles handicap, driving from scratch in 5:17½. Schuler, Autocar, with 25 seconds allowance, was second. Ruddle and his Ford entered into a 5 miles match race with Collins on an Indian motorcycle, and the latter won easily. He also rode several exhibitions and lost a 5 miles handicap to Chelini, Indian, by giving him too much leeway.

The summaries:

Five miles stock chassis, 231-450 cubic inches—Won by Murray, Buick; second, Oakes, Knox. Time, 5:50¾.

Ten miles stock chassis, 230 cubic inches and under—Won by A. Schuler, Autocar; second, Ruddle, Ford; third, Murray, Buick. Time, 11:18¾.

Five miles stock chassis, 450 cubic inches and over—Won by Murray, Buick; second, Oakes, Knox. Time, 6:02¾.

Five miles handicap—Won by Murray, Buick (scratch); second, Schuler, Autocar (0:25). Time, 5:17½.

## TRAVELING UNDER THREE FLAGS

**Detroit Crew Undertakes the Journey from Canada to Mexico—Will be a "Tour of Demonstration."**

On Monday morning last, June 5, W. H. Line and Paul H. Bruske, two members of the E-M-F staff, in a Flanders "20" motor car of the stock "roadster" pattern, left the venerable city of Quebec, Canada, bound for the equally historic City of Mexico, the abode of the Aztecs, a distance of about 4,500 miles. It is a "tour of demonstration" and "Under Three Flags" is the title which has been chosen for the

LINE AND BUSKE IN THE "UNDER THREE FLAGS" FLANDERS

undertaking, and there is easily enough of the territory of each nation represented included in the itinerary, to afford a fair sample of the conditions to be encountered in each.

In every way the crew of the Flanders "20" will endeavor to truthfully reproduce touring conditions. There is no intention on the part of W. H. Line, the pilot, to "beat it" and make the affair a sort of race against time. No schedule will be laid out for the car to follow. On the other hand, no weather will be regarded as too inclement and no road too heavy for the car's attention. It is planned to touch at Montreal, Toronto, Windsor, Detroit, Toledo, Indianapolis, St. Louis, Dallas, San Antonio and Laredo, the old Mexican state road being employed for that part of the trip under the banner of the "Sister Republic." The car which will be used for the purpose and which is fitted with Morgan & Wright tires, has been embellished with a design made up of the three flags under which it will travel. On the radiator will be carried the three flags of the countries en route, the daily itinerary determining the colors which will be accorded the center or honor position, the flag of the

particular country in which the car may be being accorded "pride of place."

### The Effects of a Kansas "Sinkhole."

Since falling into the Missouri river at St. Charles, the Regal "Plugger," which is on the "Around the Circle Tour," has met with another mishap, possibly not so startling, but quite as disastrous.

At the invitation of the Oklahoma Automobile Association, the "Plugger" crew, Messrs. Dean and Cuson, and Sales Manager Wilcox, of the factory force, who joined the "Plugger" last Saturday, decided to make a detour to Oklahoma City.

"The roads of Kansas are in an abominable condition," writes Mr. Dean, "owing to the excessive amount of rain which has

## MAYOR FAVORS THE "HORSE TROTS"

**Approves the Bill Forcing Motorists off Public Highways and Tells Objectors They are "Too Selfish."**

Those automobilists who imagined they at least would be courteously received by Mayor Gaynor at the hearing on the Cullen-Goodspeed "horse trot" bill, which will permit the Park Commissioner of Brooklyn to exclude automobiles, bicycles and motorcycles from the Ocean Parkway or Coney Island boulevard between 22nd avenue and Kings Highway, whenever he pleases, and permit this stretch to be used exclusively by owners of horses for racing purposes, received a jolt at the hearing held in the City Hall, Thursday morning last, 2nd inst. They not only received cold comfort but scant politeness.

The Mayor's reception room was crowded at 11 o'clock, the time set for the hearing. C. Andrade, Jr., who represented the New York Automobile Trade Association and the Licensed Automobile Dealers of the City of New York, appeared as the principal speaker against the bill. Mr. Andrade pointed out that the setting aside of a public highway for the exclusive use of any class of vehicles would be illegal, aside from the unfairness of the principle involved.

Herbert G. Andrews, chairman of the legislative committee of the Long Island Automobile Club, said it was a physical impossibility for the owners of automobiles to use the 25-foot side road proposed in the bill. The boulevard is the only road to Coney Island, and to close it to automobilists, he contended, would be a great loss to the business men of Coney Island.

He was followed by Dr. George W. Brush, of the Brooklyn League, who stated that his association had decided to oppose the measure chiefly because it gave unrestricted power to a park commissioner, who is a political appointee, and upon whom influence could be brought to bear. John G. Hart, who resides on the boulevard, and who said that his family had paid more than \$8,000 in taxes on their property, also objected to having the road restricted and to the holding of "horse trots" thereon.

When Mr. Hart had finished, the Mayor asked if there were any other opponents of the measure who desired to speak, and before anyone had a chance to answer he announced that he intended to sign the measure anyway. He told the automobilists that they were a selfish lot and wanted to own the earth, and that they could afford to be more generous and not oppose this slight concession to horsemen. He then declared the hearing at an end and the in-

fallen recently—perfect quagmires in some places. Where the country is swampy they are practically miniature lakes. While journeying from Wichita to Emporia, taking the road late at night, we unfortunately ran into a sinkhole. We came upon it quite suddenly. Before I was aware of it our car had sunk into the mud quite up to the floor of the tonneau. Cuson volunteered to 'drill' it back to the nearest farmhouse, where he procured shovels and a lantern. We immediately set to work to extricate our machine. We labored long into the night in an attempt to get the car out, but all to no avail. Becoming exhausted, we finally abandoned our task and took refuge in an old barn near by. This was about three a. m., and we certainly did fulfill that saying 'hitting the hay' to a 'fare ye well.' It was some time after ten a. m. before any of us awoke. Securing the service of the farmer from whom we had borrowed shovels and lantern, we managed to get the machine out, with the assistance of his team. It was well nigh toward noon before we got away from the spot, however, and we certainly were a thankful lot, for, to tell the truth, I began to think it would not be possible to save the car."

dignant motorists filed out into the corridors.

Later, the Mayor made good his threat to sign the measure. It received his official signature on Monday and was sent to Governor Hughes at Albany with the following misleading statement:

"There is no road in the Borough of Brooklyn where those who own and love trotting horses may speed them. They used to do it on the Ocean Parkway until the automobiles became so numerous that they were crowded off. All that this act does is to enable the local authorities to set off one and one-half miles of the Ocean Parkway for the use of horsemen at certain times, the automobiles meanwhile being obliged to take a side road. The owners of automobiles are generally quite content with this, as they deem it no more than just, while a few of their number oppose it, being too selfish, apparently, to see the rights of others. Very much has been done for the owners of automobiles and they should not begrudge this little to the owners of horses."

That the automobilists intend to continue the fight was made plain by the prompt action following the hearing of last Thursday. Immediately after the Mayor showed his unfairness and his antipathy toward motorists, Walter R. Lee, secretary of the New York Trade Automobile Association, telegraphed the Governor, asking for a hearing. Simultaneously with this action the law committees of the Automobile Club of America, the Long Island Automobile Club and the directors of the Licensed Automobile Dealers of the City of New York were notified by Mr. Lee and requested to co-operate in the fight against the measure.

The telegram requesting a hearing by Governor Hughes was followed by a formal protest embodied in a set of resolutions passed by the New York Automobile Trade Association, in which it was formally petitioned that a public hearing be granted automobilists. So far the Governor has not replied.

#### Killed While Lighting Rear Lamp.

An unusual accident occurred in Rochester on March 17th, when William Wernick was killed while lighting the rear lamp on his automobile. It seems that Wernick had gone until late that evening with unlighted lamps, and rounding a curve on Lake avenue was hailed by a pedestrian, who advised him to light his lamps. He promptly stopped the car and went to the rear to examine the lamp. At that moment another car came around the curve at a moderately fast pace, and before it could be stopped crashed into the rear of Wernick's machine, crushing him between the cars. He died at midnight. William H. Briggs, the driver of the second automobile, was held pending the outcome of the inquest.

## GALLANTRY FROM A GOVERNOR

**Woman Transcontinentalist is Envied by Ohio's Chief Executive—"A Girl After my own Heart!"**

Miss Blanche Scott, who, with Miss Amy L. Phillips as a companion, is engaged in making a cross-continent journey in an Overland runabout, is having the "time of her life." She has had several luncheons

world out of a car window like you two girls are seeing it in your automobile.

"I believe that if more women would get out and enjoy life in the way you two are doing the world would be the better for it. There is too much of the nervous excitement of social life among our women. Too much indigestible food and too late hours. More of nature is needed; more of the natural and less of the artificial."

When Governor Harmon was told—by the veracious historian—that Miss Scott

GOVERNOR HARMON LISTENS TO MISS SCOTT'S STORY

and dinners and other entertainments tendered her en-route and has shaken hands with a number of notables. At Utica, N. Y., she met Rear Admiral Robley D. Evans ("Fighting Bob") and she went out of her way to visit East Aurora, N. Y., to "How'dy" to Elbert Hubbard, chief of the Roycrofters. At Dayton she saw the Wright brothers and in Indianapolis she was in evidence at the Speedway championship meet. Miss Scott's star play, however, was executed at Columbus, Ohio, where Governor Harmon was induced to drop the cares of State and to come out into the street and meet the young woman and inspect her car while a photographer performed her deadly work.

According to the veracious historian of the journey, Governor Harmon grew quite enthusiastic during his chat with the fair traveler.

"I wish that I could take just such a trip," he declared, says the v. h. "After a hard winter's weary round of routine I feel like getting out and communing with Nature in just such a way as you are doing. It's the only way. You never could see the

had undertaken her trip to escape the penalty of these same things, he—the Governor—"was delighted to learn that her own experience coincided so nearly with his views in the matter."

"You surely are a girl after my own heart," he is credited with having exclaimed.

#### What a Danger Sign Did to Wood.

It seems almost as if Fate had gone to extreme lengths when it engineered the accident to Frank Wood, Chicago representative of the Knox Automobile Co., and prominent member of the Chicago Motor Club, on Memorial Day. Wood was seated in the rear of a touring car which skidded at the bottom of a hill. The skidding automobile crashed into one of the Chicago Motor Club's new iron guide posts which carry the word "Danger" on top. When the car hit the post, the latter broke and the iron sign struck Mr. Wood on the jaw, breaking jaw, cheekbones and knocking out nearly all his teeth. Not only was this particular sign put up by the club to which Wood belongs, but it was placed there at his own suggestion.

## OKLAHOMANS IN A HARD CONTEST

Six of Twelve Starters Fall by the Wayside—Confetti Trail Confusion Results in a Protest.

Six days racking over 800 miles of Oklahoma prairie and through the quicksands of the Red river not only was sufficient to wipe out all chances of a perfect score for any of the 12 starters in the Oklahoma Automobile Association's reliability tour for the "Daily Oklahoman" trophy who left Oklahoma City on the 30th ult., but also bodily eliminated half of them before the conclusion of the contest on the 4th inst. And, if this was not enough hardship for the survivors, three of them—C. S. Carris, Franklin; J. C. Davidson, Velie, and Frank Grosbeck, Oakland—were disqualified by the technical committee after the finish for deviation from the official route on the last day's run.

Regardless of whatever action the other disbarred survivors may take, the Franklin people have signified their intention of filing a protest against the ruling with the American Automobile Association on the ground that the route book furnished the contestants and the road indicated by the confetti car did not agree, and that Carris chose the confetti trail as the correct one. The confusion over the right road occurred after leaving Ponca City on Saturday, and is thought to have been due to the intermingling of the confetti trail laid by the pathfinder on its entrance to the city on the previous day with that laid upon its departure Saturday. Another car, the Ford, driven by E. C. Ross, narrowly escaped disqualification for taking the wrong route, but upon learning of his error Ross returned and started anew.

Although no official statement yet has been rendered by the technical committee following their examination at the conclusion of the contest, unofficial reports credit the Parry, driven by L. M. Dull, with having emerged from the ordeal with the highest score, approximately 950 points. Second honors are awarded to Jack Twohig's Ford, with a tally of 920 points. The only remaining rival for honors, L. H. Randall's Velie, received a crushing setback when its crank case was broken by a wristpin coming adrift during the technical examination, incurring an assessment of 200 points. In its preliminary examination before the start the technical committee established a precedent by ruling out the Inter-State because of the center-punching of bolts to prevent them from working loose; the committee held that the punching rendered the car ineligible, at it thereby ceased to fulfill its standard specifications.

Under cloudless skies, the procession of 16 cars, 12 of which were contestants, filed

out of Oklahoma City on Monday morning, 30th ult., on the first day's run to Lawton, 145 miles by way of El Reno, Chickasha and Anadarko. Mechanical troubles commenced early and at the night control only two cars had clean scores—Carris, Franklin, and J. L. McClelland, Buick. Real animal horsepower was in great demand on the second day's run to Hobart, all of the cars being stalled in attempting to ford the quicksands of the Red river, 17 miles from Altus. Although the water was shallow, some of the cars sank to the hubs in quicksand in midstream and it took hours of tugging and hauling to bring them safely ashore.

Contestants removed their footwear and waded around in the treacherous sands seeking to discover firm footing, and so deeply was one car enmeshed that it required the efforts of two pairs of horses to release it. Several cars stalled their motors in the river sands, and this, together with the use of horses, raised some doubts as to what penalizations would be inflicted, but on telegraphic request of the referee, Secretary Butler of the A. A. A. Contest Board rendered a special ruling absolving all cars from penalization for delays or assistance received at the ford.

The first car to be eliminated was A. M. Allen's Maxwell, which butted into a hidden stump in the road between Altus and the Red river, and sustained a broken frame. Owing to the difficult hills on the route, Wednesday's run to Kingfisher was changed and under the revision the distance was 143 miles.

The hard running on Wednesday was responsible for the withdrawal of J. L. McClelland's Buick, which broke a spring near Geary. This locality also proved unlucky for the Cadillac pathfinder, which broke an axle and was temporarily stranded until a new one could be fitted. During the interval the Pioneer, a locally built car, assumed the duties of pilot. On the arrival of the cars at Kingfisher Wednesday night, Carris, Franklin, still had a perfect road score, being the only one with that distinction. Due to the change in schedule, the tourists doubled on their course on Thursday after leaving Kingfisher, and after passing through Enid returned there by another route and put up for their night of well earned rest.

This was the longest day's run of the tour, 191 miles, and also saw the retirement of another contestant, the Auburn, driven by B. E. Gridley. Near Enid the car struck a section line stone and broke a rear spring, and Gridley decided to quit rather than continue under a possible heavy penalization for time lost in repairing it. As a reward for the long run Thursday, the Friday jaunt was a short one, requiring but little more than five hours to complete. Carris still maintained his spotless record of no penalizations. The night stop Friday was at Ponca City. Although a com-

paratively easy run on Saturday, the final jaunt proved unfortunate for Carris. Davidson and Grosbeck through taking the wrong road, as previously told. Another unfortunate was Fullenweider's Brush, which encountered trouble near Orlando and had not arrived at Oklahoma late Saturday night. Up to the time of his disqualification, Carris still retained his perfect road score and was conceded to be the probable winner of the trophy. The survivors were the following: C. S. Carris, Franklin; J. C. Davidson, Velie; L. H. Randall, Velie; Frank Grosbeck, Oakland; E. C. Ross, Ford, and L. M. Dull, Parry.

### Virginians in Another Endurance Run.

The Times-Despatch, of Richmond, Va., is "going strong" on automobile endurance runs. Two weeks ago it conducted an affair of the sort from Richmond to Washington and return, and this week it is fathering another, of which Raleigh, N. C., is the destination, or rather turning point. It started on Tuesday and is due to finish in Richmond tonight. Those who started were as follows: T. E. Williams, Buick; S. Stagg, Regal; E. J. Allen, Rambler; L. M. Foster, Buick; E. C. Pelouze, Chalmers; J. T. Palmatory, Chalmers; J. J. Tignor, Overland. Dr. B. A. Hord, Overland; Dr. Samuel McAnally, Maxwell; J. R. Williams, Buick; B. D. Daniels, Hupmobile; Howard Wagner, Speedwell; Fufus Williams, Buick.

### Cobe Cup Now in Speedway's Possession.

In compliance with the request of President Cobe, donor of the trophy, the Buick Motor Co. has relinquished possession of the Cobe cup, which it won at Crown Point, Ind., last June, and it has been forwarded to the Indianapolis Motor Speedway Co., where it again will be battled for on July 4. It was rumored that the Buick company was loath to relinquish the trophy, inasmuch as it will this year be raced for on a speedway instead of on the road, but as it filed a \$3,000 bond guaranteeing its return, and which would be forfeited on its refusal so to do, it evidently counted the cost of such refusal and decided to yield to the request.

### Chance for New Yorkers to "Guess Again."

Westgard & Elliott's Touring Club of America has planned to try one of the now popular "sociability-guessability" runs on the New York public. July 2-4 have been selected for the purpose. The route of the run will be from New York to Waterbury, Conn., and return, about 200 miles. Sunday, the 3rd, will be spent on a side run to Hartford, which, however, will not count in the guessing match. There will be three prizes, of which the first, a silver cup, will be awarded for the guess nearest the sealed time which will be fixed by Vice-President James S. Sherman. The entry fee will be \$10.

## TEST OF NEW YORK'S TAXIMETERS

**New Bureau Begins its Work and Finds Few Errors—The Tariff of Charges Prescribed by Law.**

Taximeters, of the several kinds which are in use in New York City, are practically all right. Manufacturers of the four or five different types of instruments in general use knew it all the time and so did the taxicab people. But the public had had periods of doubt. Indeed even now the public may want a little more convincing as to the rectitude of the fare registers because on the face of it the results of an im-

from the Plaza up Fifth avenue and returned to the starting point, after making a circuit of Central Park. The measured distance was  $6\frac{1}{4}$  miles and the metered fare should have been \$2.70.

In all but four cases the charge recorded at the end of the test was correct. Two of the other instruments charged up \$2.80, one \$2.90 and one \$2.60. In defense of the latter it was said that it had cut the course. Of the 16 cabs which strayed away from the prescribed route and meandered off up Riverside Drive, all but four registered a fare of \$4.70, the four charging up only \$4.60 in each case.

The errors, it was explained, could be accounted for by the fact that the minimum distance charge registered was a quarter

accordance with the municipal ordinance passed last year, which goes into effect 60 days after the appointment of the official inspector by the Mayor. That part of the ordinance which regulates the fares and which makes a distinction between machines designed to carry two and four passengers, follows:

"For each taxicab intended to seat two persons inside, for one-half mile or any part thereof, 30 cents. For each additional quarter mile or part thereof, 10 cents. For waiting time at the rate of \$1 per hour.

"For each taxicab intended to seat four persons inside, for one-half mile or any part thereof, 40 cents. For each additional quarter mile or part thereof, 10 cents. For waiting time at the rate of \$1.50 per hour.

IDENTIFYING INSTRUMENTS AT THE START

READING METERS AT END OF TRIALS

partial trial have shown about 25 per cent. of the instruments are in slight disagreement with the remainder. Under the circumstances, however, that ought to be considered a pretty good showing.

The trials in question, which were carried out under the supervision of Francis V. S. Oliver, Jr., chief of the bureau of licenses of New York early last week, were incidental to the formal establishment of the official system of rates and the inauguration of an august municipal inspection bureau consisting of a chief and six assistants. The bureau, having been appointed by Mayor Gaynor, with John Brennan as chief, will go to work immediately investigating the complaints of motor cab patrons who think the instruments are exaggerating.

For the purpose of the first test 31 taxicabs were rounded up and dispatched over a measured course. Through an error no less than 16 of them took another route and came home with double charges on their meters, but comparison of their readings left no room for doubt as to their approximate accuracy. The official course led

of a mile, so that while the majority of the meters registered a uniform amount, the actual distances traversed might vary within a quarter of a mile without showing any difference in the readings, while a difference of ten cents in the charge need not necessarily indicate a difference of a quarter of a mile in the distance covered. Eccentricities in driving reasonably could be expected to account for all of the high and low readings, taking into account the irregularities of city traffic and its possible delays.

The operating companies supplying the cabs for test and the forms of meter used on the 31 machines were as follows: The New York Taxicab Company, Popp meter, 8 cabs; New York Livery and Auto Company, Popp meter, 5; Mason Seaman Transportation Company, Popp meter, 3; Connecticut Cab Company, Jones meter, 3; New York Transportation Company, Kosmos meter, 5; Universal Taximeter Cab Company, Brunn meter, 2; Taxi-Service Company, Jones meter, 3; Renault Taxi-Service Company, Popp meter, 2.

Hereafter the standard rates will be in

"For each piece of baggage, 20 cents.

"No charge shall be made for hand bags, dress suit cases, or for children under six years of age."

### How a Car Started Without Assistance.

If the reports printed in some of the western papers are correct, a taxicab in Omaha, Neb., successfully performed the rather difficult feat of starting itself from a perfect stop with the engine "dead." The chauffeur had stopped the cab at the top of the hill at Capitol avenue and 20th street, and entered a house to answer a call. As the brakes were not set, or had slipped after being set, the cab started to roll down the hill. On the chauffeur's seat lay a heavy package, which was dislodged by a jolt and dropped upon the throttle pedal, holding it down and accelerating the engine. As the cab was fitted with magneto ignition and the gears were in mesh, the engine started running and the cab raced down Capitol avenue. A policeman, sighting the driverless car, managed to jump on the running board and bring it under control.

**FAN BRAKE TEST IN NEW FORM**

**How it is Employed in the Inter-State Factory—The Advantages Afforded by the new Method.**

There is no longer any question of the value to the automobile manufacturer of the dynamometer method of chassis test as a forerunner of the final road tryout. A large number of the American makers

the other forms of brake in use. Furthermore, the method is distinguished by the way in which it affords the test crew means of inspecting and adjusting the power plant and transmission. In this respect it possesses much advantage over the systems in which the chassis power test is made after the car is completely assembled except for the body.

The chassis are tested before the completion of the assembling process, and before the wheels are put on. As the accom-

the test consists merely in the operations of pushing the chassis into line with the dynamometer shaft and connecting the piping.

The dynamometer mechanism proper consists merely of a single shaft mounted on inverted shaft hangers and carrying midway of its length two cross-arms, at right angles to each other, upon which the fan blades are mounted in staggered relation. The blades are 24 by 18 inches in dimensions, and the fan diameter is five feet.

INTER-STATE CHASSIS TESTING OUTFIT EQUIPPED WITH AIR FAN BRAKES

now employ the system in one way or another, and no little ingenuity is displayed in the precise details of the process. A novel and ingenious system, differing in many respects from those in use in other factories, is that which has been worked

panying illustrations show, the bare chassis, carrying the springs and axles, steering gear, motor, transmission and propeller shaft, are mounted on transfer trucks and wheeled in front of the dynamometer stands. In place of the rear wheels, special

The sprockets on the dynamometer shaft are smaller than the driving members on the rear axle of the chassis, affording a speed increase amounting to one to two. Thus, when the fan shaft is being driven at 400 revolutions per minute, the rear axle

GENERAL VIEW OF INTER-STATE TEST ROOM SHOWING DYNAMOMETER FANS

out by the engineering department of the Inter-State Automobile Co., Muncie, Ind., and which has become a part of the routine production of all Inter-State cars.

The Inter-State method involves the use of the fan type of dynamometer by way of brake load, and therefore is both simple in construction and operation and remarkably inexpensive in comparison with some of

bosses are mounted, which carry driving sprockets, suggesting in appearance the driving members of a chain driven car. From the two sprockets, chains lead to the extremities of the dynamometer shaft. The two sprockets and chains are all the special mechanism required, with the exception of the water and exhaust leads to the motor. Mounting the chassis ready for

is turning over at 200 revolutions. A fan speed of 400 revolutions, by the way, indicates in this case an output at the rear wheels amounting to 40 horsepower and a little over. This is considered the test room equivalent of running the car up a 25 per cent. grade on high gear.

In the course of assemblage, naturally, the motor is given the usual block test.

The accompanying illustration shows the method of mounting, which is arranged to facilitate belting the fly wheel to an overhead line shaft for the preliminary running in. The regular schedule adopted calls for about two and a half hours. Afterward it is run under its own power, the output being absorbed by means of the electrical brake shown in the picture.

The engine brake consists of a form of dynamo so constructed that the field and outer frame is capable of rotation about the armature shaft. The lever arm which projects from one side of the machine affords means of weighing the turning moment of

fect carburation. During the second speed run, however, all adjustments are made in a permanent manner. Subsequently a short run is made on the high gear.

After the chassis test the final inspection is gone through with and then the car is sent out on the road for a relatively short tryout which determines finally whether the steering gear and springs are in perfect condition and also affords a final check on all running adjustments under true operating conditions.

By the more usual method of assembly and test, the change gear and axle units are "run in" separately on special racks,

its condition. Where the test is made under conditions which permit the exact operation of each and every part to be observed directly, there is much better opportunity for the detection of possible sources of trouble such as otherwise might pass unnoticed.

#### Machinery Catalog With New Features.

Parts catalogs which deal with complex machinery frequently prove confusing because of the multiplicity of similar elements which are depicted on their pages without adequate means of correlating them in the mind of the reader except by a laborious and trying mental process of assemblage. To save the customer the trouble of going out into the shop and walking around one of their machines with a parts list in one hand and a replacement order blank in the other, the National-Acme Manufacturing Co., of Cleveland, Ohio, has resorted to the novel expedient of presenting the front and back sides of its Acme automatic multiple spindle screw machine in connection with every plate of parts illustrations in its new tool and parts list.

Gummed inside the front and back covers of the book are clearly indexed cuts of both sides of the machine, the plates, which are printed on stiff cardboard, being so arranged that they will unfold and lie above the text pages when open. Each of the pages bears a large plate illustrating the parts, arranged in serially numbered groups, with references below to show their mutual relation. As the assembled views of the machine are indexed by pages and plates as well as by name, it is easy to locate any part without loss of time. The device is an instructive one and is well worth studying for its own sake, although especially intended to facilitate business between the manufacturer and his customers.

#### Two-Cycle Engine With Rotary Valves.

With the idea that the three-port type of two-cycle engine is not capable of smooth and efficient control, the Willet Engine and Carburetter Co., Buffalo, N. Y., has developed a special form of rotary disc distributing valve to take care of the crank case inlet. The valve is said to be particularly effective in fulfilling the purpose for which it was designed and to result in an unwonted degree of flexibility in an engine of the two-stroke type. Other features of the engine which are out of the ordinary are its balancing system, which has been developed by long continued experiment and the carburetters, which are made especially to suit the engines. Willet engines are made up in two, three and four cylinder units, equipped for single or double ignition, forced or natural water circulation, and in shape for automobile or marine use. The new catalog, just issued, explains the construction and general purpose of the unusual features very completely.

INTER-STATE TEST BLOCK AND DYNAMOMETER

the frame, thereby yielding a direct indication of the horsepower which is being produced. The motor is run on its own power for seven hours, after which it is taken down, inspected and readjusted. It is then installed in the chassis ready for the complete running trial.

After being connected to the dynamometer, the chassis mechanism is run for two hours on the first speed gear and at a medium rate of engine revolution. This gives ample time for the lubrication system to take up its work, and also affords opportunity for a complete inspection of all visible moving parts, in order to make sure that they are running smoothly and that there are no alignment difficulties.

The gears are then shifted to second speed and the engine run for a sufficient length of time to repeat the inspection and also to make adjustments to the valve gear, timing mechanism and carburetter, as well as the gear changing mechanism. During the first run the engine is operated under special conditions, with an excessive oil feed, and no attempt is made to secure per-

much in the same way that the "green" engine is worked down into shape in the earlier stages of the bench test. Thereafter they are assembled into the chassis, which is completed practically ready to receive the body, before it undergoes further testing. Regardless of the exact method of trial pursued from that point on, it is evident that whatever adjustments or replacements may be necessary as a result of errors in the work of assembly must be more or less affected by the presence of the complete mechanism of the vehicle.

With the method above described, there is the advantage that the engine and transmission mechanism are perfectly accessible. This facilitates the location of any knocks or pounds, and assists in the work of remedying their causes, also permitting any errors to be corrected before there is opportunity for them to work any damage. Naturally when a car is being tried out on the road there is little or no opportunity for examination of the parts while in operation, and the tester ordinarily trusts to the performance of the machine in gauging

## CONTROL FOR COMMERCIAL CARS

**Its Additional Automatic Requirements over that for Pleasure Vehicles—Mechanical Substitutes for Skill.**

Figured from one point of view, it should be possible for the commercial vehicle manufacturer to save each and every one of his customers something like \$13 a week merely by installing suitable automatic control on his product. With it, according to this line of reasoning, the owner could get the same sort of results by employing an ex-teamster at \$12 a week that he could obtain with a trained chauffeur for whose services he would have to give at least \$25. What is required is an operating system as simple to work as the combination of controller and hand brake on a trolley car. But because it is not easy to develop such a system, building on the experience gained in the manufacture of pleasure cars, commercial vehicle manufacturers have been a little slow in coming to the point.

As in nearly every other respect, the commercial branch of the industry suffers from too intimate contact with the conditions which have given birth to the pleasure vehicle. The original impression that the difference between a passenger car and a freight car is a matter of weights and speeds alone still clings, despite the evolutionary efforts of the past two or three years. And the merchant who vainly expects the unmechanical driver of the \$1,500 delivery wagon to produce as many hours of uninterrupted service as his chauffeur produces with a \$3,000 touring car may not encounter very strong contradiction even when he carries his troubles to the man from whom he purchased the commercial car. Perhaps if the trade and industry had gained a better appreciation of the essential distinction between the operating conditions surrounding the two classes of machine, the commercial vehicle user would gain more sympathy than ordinarily falls to his lot at the present time.

The ideal control system would be one which equalled in simplicity the controlling arrangements of the electric vehicle. And it is not too much to say that almost any manufacturer well could afford to spend a considerable amount of money in producing a method of governing the gasoline car which would meet this requirement without at the same time introducing embarrassing first cost or unreliable mechanism.

The great difficulty lies in the choice of a suitable method and one free from complications. As is true in all mechanical matters, the accomplishment of any given operation involves a stated number of steps; reducing the number of manual impulses required to accomplish the operation

consequently involves a corresponding increase in the complexity of the machine movements. The designer's problem is to seek a successful compromise between the extremes of mechanical simplicity and functional complexity, on the one hand, and functional simplicity with involved mechanical arrangement on the other.

With the pleasure vehicle, the problem is relatively simple because the designer seeks the best results obtainable regardless of cost of production, and with the question of simplicity as a secondary consideration. The first thing to do is to produce a successful handling gear. Economy, simplicity and appearance are less important.

HYDRAULIC SPEED GOVERNOR

The commercial vehicle problem, however, raises to a position of first importance a number of these secondary considerations. In order to be successful, the commercial car must be as simple and inexpensive to operate as it is possible to make it. Without these advantages, its ability to haul stated loads and to withstand long periods of service is not sufficient to render it a worthy competitor against the horse. Appreciation of this principle is of immeasurable importance to the industry.

So the commercial vehicle designer is compelled to begin at the beginning and reconstruct his ideals almost without regard to the conclusions which may have been reached in the pleasure car field. The utility of the engine governor is an important point in question. Attention already has been called more than once to the need of a governor on business wagons; several manufacturers already are using them, and it is probable that others will install them in the course of a year or two.

The need for the governor is two-fold. In the first place, it protects the motor from strains which might result from racing under careless handling; in the second place, it relieves the operator of the bur-

den, however small, of attending to the motor in addition to looking after the other matters which are involved in vehicle management. The governor further is useful in limiting vehicle speeds to a safe maximum. Thus, as advocates of a general return to the old principle of keeping the motor under automatic regulation practically all the time are at some pains to point out, the careless operator, who might be inclined to speed his machine when returning light after delivering a load, is prevented from doing so. Thereby the vehicle is safeguarded against the unnecessary stresses resulting from high speeds.

The principle is carried further in providing a safeguard against excessive vehicle speeds under load on down grades, thus eliminating the possibility of the machine's running away.

Here enters the question of proper correlation between the driving and retarding mechanism. What may be termed standard vehicle control provides only one interconnection between the power plant and the brakes, as a rule, that is to say, in the interconnection between the clutch and the emergency brake lever, and rarely between the service brake pedal and the clutch. In foreign commercial vehicle practice, however, several other methods of speed control have been employed in which tendencies to excessive speed may be checked without the necessity of declutching.

Apart from the governing facilities offered by the electric transmission, the engine itself is employed in at least one case. In this the carburetter is provided with means for shutting off the fuel entirely and opening an air port, the effects in question being secured when the throttle lever is placed in the neutral position. Further movement of the throttle lever serves to displace the exhaust cam shaft, thereby causing the exhaust valves to open, for a short time only, at the end of each up stroke of the piston, remaining closed for the balance of the two strokes. At the same time, the inlet valve operation is altered in such a way as to permit the pistons to induct pure air on each down stroke, the result being that the engine temporarily is transformed into an air compressor. The general effect is to cool and scavenge the cylinders, at the same time producing a braking effect equivalent to about three-quarters of the maximum engine power. This braking effect, needless to say, is secured without changing gears, releasing the clutch, or otherwise manipulating any of the control mechanism except the throttle lever.

With the object of securing an equally smooth acting speed regulating system, another foreign designer recently has produced a water brake controller, in which, as is the case with the engine compression brake, the retarding effect is proportional roughly to the speed. The device in question, however, is designed chiefly to pre-

vent dangerously excessive speeds, rather than to act as a positive brake.

As the accompanying illustration shows, the device consists merely of a small paddle wheel mounted horizontally in a casing beneath the driving shaft and directly in front of the gear box. By means of the lever D, the operator may engage the bevel driving gears B-E, thus causing the paddle F to be driven from the main shaft A. The churning of the liquid in the tank G produces a resistance which, while of relatively small effect at very low car speeds, rises to great power as the speed increases.

Any mechanism of this class, it must be admitted, would seem to defeat the real purpose of the designer in securing the desired mechanical results at the smallest possible expenditure of materials. The possibilities residing in the engine itself as a braking medium, especially when coupled with the certainty of restarting which magneto ignition affords, would seem to be all that is required under the circumstances.

Still considering the pure ideal type of vehicle, it appears that there is no real difficulty in the way of applying an automatic governing mechanism to such a control system, thereby insuring the vehicle against excessive speeds under any and all circumstances. For simplicity's sake, the full compression cycle might be dispensed with on medium powered and light vehicles, and the retarding effect automatically secured through the compression of pure air handled in the sequence of the regular cycle. To accomplish this, it would be necessary only to provide a tight closing throttle in the induction pipe, and a supplementary air valve in the upper part of the pipe, or preferably in the manifold itself, which would be opened upon progressive movement of the engine control beyond the position of full throttle closing.

As for the control itself, by the use of the "set spark" form of magneto, it is possible to eliminate one lever and to reduce the engine controlling devices to the single throttle lever and the indispensable accelerator pedal, interconnected with it. The lever-pedal mechanism, of course, can be interconnected with the automatic governor in such a way as to permit the operator to control the action of the engine up to safe speeds, but to allow the governor to close the throttle and open the air port as soon as the safe limit is exceeded. Such an arrangement could be made perfectly satisfactory in its action and shielded from the tampering fingers of the operator by means of seals; its accomplishment would require but little experimentation, since it involves merely the application of certain familiar principles.

Another important point in connection with the mechanism of control is the arrangement of the handling gear. In a number of vehicles at present in use, it is apparent that the range of physical effort required of the operator is greater than it

might be. While primarily consideration for the driver's bodily comfort would seem to be of no very material importance, second thought makes it apparent that it is. As the simplicity of the controlling operations is increased and their range reduced, the amount of mental and physical effort involved in manipulating the vehicle is rendered suitable to be placed in the hands of the driver of limited attainments—which is to say, the cheap and unskilled man. The less there is about the machine to puzzle and worry the driver or to render him liable to make expensive mistakes, the simpler becomes the labor problem and the lower the labor cost.

To take a single, rather significant example, the French 'bus chassis which are extensively used by the Fifth Avenue Coach Co., in New York City, are so constructed that the two principal running speeds are obtained when the gear shifting lever is at the extremes of its rather long movement. The result is, that the operators constantly are forced to bend close down over the wheel in order to reach the slow speed, which is used for starting under heavy loads and for taking the steeper grades encountered, the genuflexion being repeated many times in the course of each trip. While this is seemingly a trivial matter, it is evident that were the gear so arranged as to make these important changes possible without bending or stretching the arm to its full length, the day's work would be less fatiguing and the driver would be able the better to attend to the essential matter of guiding the car.

On many motor cabs, inconvenient arrangements of the control mechanism are found which, seemingly unimportant in themselves, are magnified when it is considered that the driver must repeat certain movements endlessly in the regular routine of his work. Simplifying that routine likewise simplifies the exactions of the job and enables the employer to get better results at the same cost or the same results for less. In heavy commercials the mere range of movements is less important, but the question of simplicity of movement is no less important than it is with the more rapid moving passenger cars.

Recognizing that the simplification of the handling mechanism has a direct bearing on operating costs, it will appear that the mere reproduction of the arrangement which obtains under the more advantageous conditions of pleasure car practice is not doing full justice to the business wagon. It is necessary that conditions should be studied with regard to the skill and convenience of the operator quite as much as in respect to purely mechanical phases of its use. High mechanical and thermal efficiencies will reduce operating costs, but not as rapidly as will low labor charges. Every detail of the commercial car must be considered in the light of a business problem as well as an engineer-

ing problem. Only when treated on that basis can there be much chance that progress will be as rapid and certain as external conditions will warrant.

#### Why Strained Fuel for Steel Tanks.

Although considerable advantage may result from the use of steel gasoline tanks, of the type which several manufacturers have adopted on some of their models, there is one possible source of danger in their use which should be carefully guarded against. That is the risk of corrosion resulting from water in the fuel. Despite the fact that the interior may be thoroughly tinned there is some chance that if water is allowed to remain in the tank for any length of time, rusting may begin, in which case the life of the metal will be surprisingly short. As the water always settles to the bottom of the tank, the points to be guarded are those around the lower part which are so shaped that they form pockets in which such accumulations might remain. As a means of prevention it is well not only to make sure that no unstrained gasoline is permitted to go into the tank, but also to see that the receptacle is cleaned out periodically.

#### Attentions that Keep Cars Looking Fresh.

Proper maintenance of the appearance of the car depends not so much upon the frequency with which the body and gear are "done over," in the language of the paint shop, as upon the thoroughness of the daily attention which it receives. If care is taken to see that all dents and chipped spots in the paint are covered immediately with suitable patching paint mixed with varnish and turpentine; if the muffler and exposed parts of the exhaust line are kept well blacked with stove polish; and the floor mats, running boards and fenders kept in proper condition, the machine will retain its fresh look much longer than naturally would be expected. Because these are little attentions which are not included in the average garage service, the average chauffeur is pretty apt to overlook them too.

#### Selecting Horns by Telephone.

Assisting customers to choose automobile horns by telephone represents one of the most advanced phases of motor accessory merchandising. No small part of the retail business of most automobile accessory and supply houses comes in the form of telephone orders, since owners now have a great familiarity with the different brands of goods and are able to indicate their wants with precision over the wire. In choosing a horn, however, the customer generally desires to select a tone which pleases him. Enterprising accessory salesmen have discovered that it is a simple matter to bring the different horns to the telephone and sound them, so that the customer easily can make a selection that will be satisfactory when the horn is delivered.

**BARON TO TRY GLOBE-GIRDLING**

**Belgian Nobleman Starts to Tour World in American Car—May Cross Behring Straits on Ice.**

On Monday last, 6th inst., Baron Van der Noot de Vrokom de Moorsel, a member of the Belgian consulate at Detroit, started from that city on what is described as an around the world tour, which is far more ambitious in its nature than any venture of the sort yet undertaken. Other globe-girdling tours have been launched with great flourish of trumpets and much preparation in the way of locating supply sta-

DEPARTURE OF BARON VAN DER NOOT FROM DETROIT

tions, arranging for relays of spare parts and the getting together of special equipment, but the Baron apparently purposes taking "pot luck." As the picture shows, the Baron will travel in a Krit car, which is a regular stock model. His departure was marked by an informal farewell from Mayor Breitmeyer.

It is Baron Van der Noot's plan to proceed at once to Brussels, where he will represent the Krit Motor Car Co. at the forthcoming industrial exposition. Afterward, he will continue eastward through Germany, Russia and Siberia and will make an attempt to reach Alaska by crossing Behring Straits on the ice. In following the route already outlined, much of the distance will be covered on the course of the New York to Paris race of two years ago. The Siberian-Alaskan part will be new.

**"Automobilitis" Claims Youthful Victim.**

"Afflicted with automobilitis" was the excuse given by Douglas Gensinger, fifteen

years old, when arrested by the police of Chicago, Ill. The boy asserts that the mania for stealing automobiles has grown so strong upon him, that it is irresistible. During the last month, the police say, the boy confessed to having stolen and abandoned half a dozen machines.

Gensinger was arrested in company with Philip Kane, also fifteen years old, charged with stealing an automobile. The boys had just "taken" a car, and after a lengthy joy ride abandoned the machine. "I just can't resist the temptation to jump into every machine I see standing, and ride away with it," Gensinger is said to have told the police. "I never meant to steal them; I always left them after a short ride. Ever since I first rode in a machine I have been

afflicted with the mania. I did not mean any harm." Gensinger had been arrested on a similar charge three weeks before, but allowed to go home with a warning. Now both he and his companion were sent to the juvenile home.

**Motors Replace Horses on Famous Route.**

Motor cars carrying 20 passengers have taken the place of the old horse-drawn coaches that ran for years on the famous scenic routes from Bantry to Glengarriff, Kenmare and Killarney; also from Kenmare to Parknasilla, Waterville and Cahirciveen, as well as the longer route from Macroom to Glengarriff. Passengers can now leave Cork in the morning and get through to Killarney in one day, the route being by way of Bantry, Glengarriff, Kenmare, Parknasilla and over the mountains by a place called Windy Gap into Killarney. The new route gives 20 miles more of charming Irish scenery as compared with that taken by the old coaches.

**RAIN SPOILS ST. LOUIS SCORES**

**No Clean Sheets Left in 100 Miles Endurance Run—Seven of the Nineteen Fail to Survive.**

If it had not rained last Saturday, 4th inst., it is likely the third annual reliability run of the Automobile Club of St. Louis might have provided a few perfect scores and some pleasant hours on the road. But it did rain and consequently not a single one of the 19 contestants that started the 109 miles course in the morning brought home a clean card at night. To be sure, only seven cars fell by the wayside and actually withdrew from the contest, and some of them returned with the others after more or less protracted delays. The ranks of the round dozen survivors were further depleted later when the technical committee made its critical rounds. Fred H. Semple, who drove a Locomobile, won the James Hagerman, Jr., silver cup for touring cars.

Five controls were located on the circuit from St. Louis to St. Charles and return, at Fenton, Byrnesdale, Pond, the luncheon stop and the only point at which engine shut downs were permitted, Creve Coeur and Florissant. A driving rain delayed the start and furnished the hazards which put out five of the cars before the first half of the trip was over.

Two machines, William H. Boehmer's Buick and J. L. Adrien's Fal, were ditched at the same spot, a mile on the near side of the Byrnesville control. The second machine had to be rescued with a team of horses, so deep and adhesive was the mud. But that same plastic mixture served a useful purpose in the case of the Stearns car driven by Charles W. Wall, Jr., which also went into the ditch and incidentally took fire. Handfuls of the mud dashed into the flames soon extinguished the blaze and the machine went on, only to take fire a second time. It was then withdrawn.

A. B. Byrd, Jr., had the misfortune to break the driving shaft of his Marmon soon after leaving Eureka, and he dejectedly went home by train. The White steamer, entered by P. D. C. Ball, suffered through the poor adjustment of something that had gone wrong before the start and trailed along in tribulation for three hours and a half before the difficulty was located and remedied. It was reported withdrawn at the first control.

Miss Ida Britton, the only woman driver in the run, had nervous trouble after skidding into a wagon around which she was endeavoring to pilot her Pope-Toledo touring car, and after being delayed on account of the slight damage done to the wagon, withdrew. The Packard car, driven by Joseph Dixon, Jr., suffered from a heated

bearing as a result of a broken oil pipe.

One of the conditions of the event, which proved conclusively that the management had not played in close touch with the weather gods, provided that any contestant who was forced to drop out after leaving the first control should have returned to him one-half of his \$5 entry fee. This served as a partial consolation to several of the contestants.

The survivors of the run were the following: L. Boland, Jr., Cadillac; C. M. Barnard, Mitchell; Fred H. Semple, Locomobile; W. A. Meretio, Marmon; Ralph H. Smith, Matheson; S. E. Wolff, Hudson; A. A. Kelley, Cadillac; Dr. O. T. Upshaw, Kisselkar; Frank H. Pingree, Cadillac; Samuel J. Pingree, Chalmers; John, H. Flachmann, Cadillac; C. H. Albers, Locomobile.

#### When the Chauffeur Fell Asleep.

When a chauffeur in charge of a taxicab falls asleep while the latter is going at a good rate of speed, something is bound to happen. That's what a Chicago policeman said after he had been dumped into Lake Michigan. The cop was sitting as "protection" alongside a very tired chauffeur during the present strike in Chicago, when the taxicab was hailed by a passenger who desired to go to a yacht club on the lake shore. There is a rather steep incline towards the water near the club and the taxicab was making fast time. When within a hundred feet or so of the water, the policeman was wondering why the chauffeur did not slow up and turn parallel to the shore, when suddenly he noticed that the driver was sound asleep. Before he could jump or awaken the man, the taxicab ran full speed into the lake, spilling policeman, chauffeur and passenger into the water. Luckily nothing worse than a thorough soaking happened to the trio.

#### Neglected Roads Cause Suit for \$10,000.

Claiming that the miserable state of the roads of Shawney county, Kansas, was responsible for the death of her husband, Mrs. Ada E. Scott has filed suit in the United States Circuit Court against Soldier township, Shawney county, asking for \$10,000 damages. In her petition Mrs. Scott asserts that the accident to her husband and a party of friends, who were out driving in an automobile, was due to the neglect of the township to keep the roads in good condition.

#### 400,000,000 People Use London 'Buses.

According to the latest statistics obtainable, the automobile 'buses of London carried during the fiscal year 1909-1910 400,000,000 passengers, or 1,100,000 per day. The total number of motor 'buses in use there is 1,180, while there are still 1,771 horse-drawn 'buses rolling over the streets of the English capital. Seventeen thousand six hundred horses had to give way to the motor "stages."

## CAN'T ESCAPE SECOND OFFENSES

Higher Court Holds it Proper to Present Proof of Previous Convictions—Sustains New York's District Attorney.

The District Attorney's office of New York county scored a victory on Tuesday, June 7th, in its fight against the judges of the Court of Special Sessions in automobile speeding cases. In the Reppin case some few weeks ago, Justice Olmsted decided that the District Attorney could not prosecute as a second offender a driver who had not been specifically so charged in the Magistrate's court, a decision which threw into confusion the established procedure of that court. To meet this situation, C. S. Whitman, the District Attorney, devised the plan of rearresting the chauffeurs and recharging them before the magistrates whenever a consultation of the records showed a previous conviction.

This procedure brought a protest from the drivers themselves, and a test case was arranged for. Joseph B. Burns, a driver who was arraigned as a second offender after he had been once held as a first offender by a magistrate, sued out a writ of habeas corpus before Justice McCall, declaring that the commitment was illegal and void because he had already been arraigned and held for trial on the same charge of speeding.

"The proceeding was justifiable and legal," says Justice McCall in declaring that the writ of habeas corpus cannot be sustained. "While it is true that practically all the features of the first offence charged are present, constituting in large part the basis of the proceeding on the second arraignment, there is injected into the latter the question of the second offense, which if sustained, aggravates the charge and carries a much heavier penalty. This is sufficient to differentiate between the two and determine the validity of the second arraignment.

"One added reason which should carry force is that if the contrary be held the situation would be presented that the established fact was recorded that the relator was a second time offender and through the attitude assumed by the Court of Special Sessions in its ruling the District Attorney could not bring that fact to the court's attention, and if this writ were sustained he would be powerless to take any steps to establish the fact by an arraignment for a second offence; a condition which established technically would simply be intolerable."

The Court remarks that it makes no difference whether the second arraignment be before the same magistrate as the first or before another magistrate.

The hundred-odd cases of speeding that have been held up in Special Sessions pending the decision in the Burns case now will be pressed to immediate disposition.

The new law which goes into effect August 1 will put an end to such cases.

#### Striking Chauffeurs Discover New Trick.

Some ingenious taxicab chauffeur who has been out of work ever since the long-drawn-out Chicago strike started, has discovered a trick which causes much financial embarrassment among the men who have taken the striking chauffeurs' places, without running the risk of interference by the police. It consists of flipping down the little flag on the taximeter whenever it can be done unobserved, with the result that the unlucky driver of the cab finds himself several dollars shy in his account at night. On the morning of Decoration Day several union sympathizers walked along a row of non-union cabs standing at the curb in front of one of the big hotels and turned down four of the flags. It was more than an hour before the chauffeurs discovered that their meters were registering. At present there appears no redress in sight for the cheated chauffeur, for it an offender is caught in the act, there is no real damage occasioned and the chauffeur can not press a charge which will stand before a magistrate. On the other hand, if the meter has registered owing to some interference, the culprit usually is far away by the time the trick is discovered.

#### Motorists Wield Picks and Shovels.

Although theoretically every automobile club expresses itself as in favor of good roads, not many have taken up good road work in such a practical and unique way as the Austin Automobile Club, of Austin, Minn. Every Thursday afternoon the entire club takes a run into that section of the county in which roads need repair and tackles the repair job on the spot. Each member is provided with a pick and shovel, and a generous lunch basket. A pilot car runs ahead with an abundance of stakes; at every rough place and depression in the roadway, at every culvert or bridge approach where the filling has settled, stakes are driven at the side. The fleet of automobiles following the pilot car stops at each stake, fills in the ruts, smooths the road, and then hurries on again. The sixty members of the club are keeping the roads in splendid condition.

#### Cost of Motor Service in London.

What it costs to maintain a high-class automobile in London may be calculated from the advertisement of a garage which offers a complete motor service for \$2,000 per year, if customers will take it for three years. Or they may pay \$2,500 the first year, \$2,000 the second, and \$1,500 the third year, with the option of discontinuing the service at the end of each year.

THE NEW  
**Rambler**

Rambler Fifty-five, 45 H. P., \$2500  
with Magneto, Lamps, Presto-Lite Tank and Tools.

*Rambler workman watching  
indicator which registers  
any variation between  
gear centers.*

Service depends upon the quality of steels used in vital parts such as transmission gears and the accuracy attained in the making. Every Rambler gear is subjected to most exacting tests, the most delicate instruments being used to detect the slightest variation which might, by increasing friction, detract from the smooth running qualities of the car.

## Thomas B. Jeffery & Company

Main Office and Factory: Kenosha, Wisconsin

Branches: Chicago, Milwaukee, Boston, Cleveland, San Francisco

## RECENT PATENTS.

956,324. Timer for Combustion Engines. Paul B. Fant, Newark, O. Filed Nov. 29, 1909. Serial No. 530,389.

1. A timing device of the character described, comprising a stationary crucible-shaped support, contacts increasing in width toward the upper ends thereof arranged within said first named support, a contact element pivotally mounted upon one arm of said approximately U-shaped support, the other arm of said U-shaped support serving as a guide for said contact element, and said contact element being adapted to be actuated by centrifugal force.

956,405. Internal Combustion Engine. Abner W. Nichols, Augusta, Me., assignor to Cushnoc Motor Company, Augusta, Me., a corporation of Maine. Filed Oct. 28, 1909. Serial No. 525,151.

1. In an internal combustion engine, the combination of a crank casing, a main shaft having a cranked portion mounted therein, a charging cylinder in said crank casing, a piston in said cylinder, a piston rod rigidly connected to said piston and guided by a part of said crank casing, an explosion cylinder located on top of said crank casing, a valve cylinder connected to said explosion cylinder and to said charging cylinder, a valve in said last named cylinder, a piston in said explosion cylinder, and connections between said pistons and said main shaft, including a connecting rod running from the piston in the explosion cylinder to the cranked portion of the main shaft, said connecting rod being provided with a triangular extension, and a connecting rod pivoted to said extension and to the piston in the charging cylinder, said last named connecting rod extending across and above the main shaft, whereby accurate timing is attained, substantially as described.

956,587. Roller Bearing with Angular Rolls. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Co., Harrison, N. J., a corporation of New Jersey. Filed Sept. 22, 1909. Serial No. 518,927.

1. In a roller bearing, the combination, with a hub having a conical seat and a collar at the smaller end of such seat, of a series of conical rolls fitted to the conical seat and having their ends fitted to the said collar, each roll having a neck at the larger end, a cage with pockets fitted to the sides of the several rolls, a casing having tapering seat to embrace the said rolls and an annular recess at the larger end of such seat, and a clamp-ring fitted to turn in such recess and fitted to the necks of the said rolls and operating to confine the rolls in contact with the collar.

956,588. Combined Roll and Ball Bearing. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Co., Harrison, N. J., a corporation of New Jersey. Filed Nov. 1, 1909. Serial No. 525,609.

1. An anti-friction bearing having a hub with doubly conical seats and a casing with tapering seats opposed to the seats on the hub, and two series of balls and rolls adapted and arranged to roll between the seats upon the hub and casing, the balls of the two series and the rolls of the two series being arranged in pairs with the members of each pair in contact.

956,592. Tire Inflator for Automobiles. Hiram P. Maxim, Hartford, Conn. Filed July 13, 1909. Serial No. 507,432.

1. The combination with an internal com-

bustion engine for an automobile having a plurality of cylinders, of means for conducting the burned gases from one of said cylinders to one or another of the tires to inflate the same, and means for cutting out ignition in all of the other cylinders of the engine during inflation.

956,611. Automobile Wheel. Will Tischbein, Hanover, Germany. Filed July 29, 1908. Serial No. 446,017.

1. A wheel provided with a main rim having an aperture, an auxiliary rim circumferentially spaced therefrom, means for detachably securing said auxiliary rim in position on the main rim, projections on one of said rims in the circumferential space between said rim located on either side of said aperture, a single projection on the other rim also in said circumferential space adapted to enter the space between said two projections to prevent creeping of the auxiliary rim, said single projection being provided with an aperture arranged to align with the aperture in the main rim for the accommodation of the valve stem.

956,676. Separator for Anti-Friction Bearings. Fred E. Bright, Philadelphia, P. Filed June 9, 1908. Serial No. 437,546.

1. A separator for anti-friction bearings comprising a spherically formed separating element and a lateral retaining element connected thereto, the said retaining element being distinct and independent from the retaining element of any other separator.

956,735. Vehicle Wheel Tire. Antony T. Scaramozzi, Paterson, N. J. Filed Sept. 18, 1909. Serial No. 518,368.

The combination of the rim of a vehicle wheel, a tire proper having its lateral edges interlocked with the rim and spaced continuously from each other, an inner tube arranged in the tire proper, and a puncture-resisting medium interposed between the tire proper and the inner tube and comprising an endless series of puncture resisting devices articulatively connected with each other and arranged in the tread portion of the tire between the tire proper and the inner tube and stiff flexible strips receiving between them said devices and each having its lateral edges abutting against each other opposite the space between the lateral edges of the tire proper, both edges of the outer strip engaging the rim between said lateral edges of the tire proper, substantially as described.

956,882. Floatless Carburetter. Martin C. Bright, Indianapolis, Ind., assignor of one-half to Charles W. Meikel, Indianapolis, Ind. Filed July 23, 1908. Ser. No. 444,955.

1. A carburetter of the above specified class comprising a body portion provided with a primary and secondary air intake and a gas outlet port, an auxiliary oil reservoir arranged adjacent to said body, a valve to admit oil to said reservoir, an oil spraying valve communicating with said oil reservoir, an oil spraying valve communicating with said oil reservoir, means adapted to maintain a uniform oil level within said oil reservoir, a throttle valve within both the primary and secondary air intakes, means for applying tension on the valve in the secondary air intake, a throttle valve within the gas outlet port, and a single means for imparting synchronous movement to actuate the aforesaid oil admission valve, the valve in the primary air intake, the valve in the said gas outlet port, and to relax the tension on the valve in the secondary air intake.

956,884. Inner Tube for Pneumatic Tires.

John H. Brown, West Hoboken, N. J., assignor to Brown Perfection Tube Co. Filed Nov. 24, 1909. Serial No. 529,738.

1. In combination, a restraining casing, an inflatable tube within the casing and a substantially non-yielding strip of material permanently secured to the inflatable tube along peripheral lines spaced apart, the portion of the inflatable tube between said peripheral lines being normally in a non-compressed condition and having a greater normal width than the width of the non-yielding material between said lines and adapted to be forced into the circumferential plane of the tube when the tube is inflated.

956,906. Muffler. Edward D. Sizer, Sizer-ville, Pa. Filed Jan. 24, 1910. Serial No. 539,737.

1. A device of the class described comprising a spiral casing and said casing having a spiral slot co-extensive with the length of said casing.

956,952. Automatic Stopping Device for Motor Vehicles. Victor Emden and Frank H. Dearborn, New York, N. Y. Filed Feb. 16, 1910. Serial No. 544,180.

1. In an apparatus of the class described, the combination with a motor vehicle, of a guide carried thereby, a contact device having a rod fitting said guide and provided with a circuit controller arranged to normally occupy a closed position, and a locking device arranged to co-operate with said rod when the circuit-controller is in open position and maintain said parts in condition to prevent the operation of the motor until said parts are restored to normal position by manipulation of the lock by the operator.

956,954. Spare Tire Holder for Automobiles. John E. Fahlstrom, Bridgeport, Conn., assignor of one-half to Clifford B. Hickox, Bridgeport, Conn. Filed Oct. 15, 1909. Serial No. 522,736.

1. A spare tire holder comprising a back bar having its outer end terminating in a hook, a collar slidable on said bar, a latch bar having one end pivoted to said collar and having its opposite end formed with a hook, a locking lever having a handle at one end and a hook at the other, the back face of said hook being extended to form a cam face which conformably engages in said hook of the back bar, and a link connected with the hook on the latch bar and the hook on the locking lever.

956,967. Internal Combustion Engine. James H. Hopkins, Manchester, England. Filed Aug. 31, 1909. Serial No. 515,535.

1. In an internal combustion engine, a pair of cylinders of integral twin formation and differential bores, a charge admission port in the wall of each large and an exhaust port in the wall of each small bore cylinder, means for linking the said two charge admission ports and exhaust ports respectively together, a joint charge admission pipe and a joint exhaust pipe connecteppd with the respective linking means, a charge outlet port in the wall of each large and a charge inlet port in the wall of each small bore cylinder superposed above the said charge admission ports and means for crosswise connecting the said charge outlet and inlet ports and thereby transferring the charge from the large to the small bore cylinders, all combined substantially as and for the purpose set forth.

957,010. Means for Automatically Con-

trolling Lamps on Vehicles. Roy C. Stanley, Cloyde, Ohio. Filed Aug. 14, 1909. Serial No. 512,834.

In devices of the kind described, a vehicle frame having forwardly projecting portions at its front and concave sockets immediately upon the top thereof, in combination with lamp supporting yokes provided with substantially semi-spherical balls seated in said sockets and one of said yokes having an arm extending beneath and within the sides of said frame, operating connections with the said arm, and a link connection between said yokes.

957,109. Internal Combustion Engine Timer. Joseph A. Schneider, Lakeport, Cal., assignor of two-thirds to Andrew A.

Brown, San Francisco, Cal. Filed June 29, 1909. Serial No. 505,078.

1. In an electrical timer, an exterior annular casing, a shaft revoluble about the common center, a pin fixed eccentrically to the end of said shaft, a hub revoluble upon the pin, widely separated contact points projecting inwardly from the interior of the case, and widely separated points projecting outwardly from the circumference of the revoluble hub and coacting with the first-named points to impart an intermittent rotation to the hub.

957,253. Automobile Heating Appliance. Charles A. Prescott, Brooklyn, N. Y. Filed June 17, 1909. Serial No. 502,788.

1. In an automobile provided with the

# KLINE KAR

**Do you know what trouble is? Get a Kline-Kar**  
**and know what trouble is not.**

Kline-Kars represent the ultimate in motor car satisfaction, not only in efficiency, but in smoothness of operation, cleanliness of condition, and attractiveness of appearance and design.

**Kline-Kars have no superiors at any price.**

Their reliability has been proven "in the open" in the most severe endurance runs and in competition with the best known and highest priced cars of the world.

Our 1911 line will be unusually complete and our agency proposition decidedly interesting. Write us.

usual body and internal combustion engine, the combination of an exhaust conduit for such engine, an air pipe surrounding said conduit, means for placing said pipe in communication with the automatic body, a tube extending through said exhaust conduit with its respective ends in free communication with said pipe, and means for forcing air through said pipe and tube, substantially as described.

957,263. Transmission System. John Schlig, Chicago, Ill. Filed Jan. 10, 1908. Serial No. 410,157.

1. In a transmission system, the combination of an axle to be driven, a main gear on said axle having gearing surfaces, a main shaft, driving pinions on said main shaft meshing with gearing surfaces on the main gear, means for independently connecting any one of said driving pinions with the driving shaft, an additional driving pinion always meshing with another gearing surface on the main gear; a counter shaft supporting said additional pinion, gearing mechanism on said driving shaft, gearing mechanism on said counter shaft, and clutch mechanism associated with said gearing mechanisms for connecting said main shaft with the counter shaft to cause either forward or reverse rotation of the counter shaft and of the additional pinion to thereby cause either forward or reverse rotation of the main gear.

957,285. Valve for Gas Engines. Robert White, Beaver Falls, Pa., assignor of one-half to E. S. Burns, Beaver Falls, Pa. Filed May 19, 1909. Serial No. 496,976.

1. The combination, with a cylinder and a valve casing having a main port between them, the said valve casing having also an inlet port and an outlet port on the opposite side of it from the said main port and at different levels from the main port and from each other; of a hollow rotary valve journaled in the said valve casing and provided at opposite sides with ports which place the main port in communication with the said inlet and outlet ports alternately as the valve is revolved.

# REISSUES.

13,108. Rotary Valve. Lee A. Frayer and Charles O. Howard, Columbus, Ohio, assignors, by mesne assignments, to The Kouns Manufacturing Company, Detroit, Mich., a Corporation of Michigan. Filed April 22, 1909. Serial No. 491,657. Original No. 908,656, dated Jan. 5, 1909, Serial No. 392,548.

1. In an explosive engine a rotary valve journaled adjacent its ends in bearings whereby it is maintained out of contact with the valve chamber walls, said valve having a passageway therethrough adapted at one point in each half revolution to admit a charge to the explosion chamber, and at another point in each half revolution to permit the discharge of the burned gases therethrough, and means for driving said valve.

13,111. Carburetter. William H. C. Higgins, Jr., Laporte, Ind., assignor, by direct

and mesne assignments, to M. Rumely Company, Laporte, Ind., a Corporation of Indiana. Filed Jan. 10, 1910. Serial No. 537,367. Original No. 856,638, dated June 11, 1907, Serial No. 326,021.

1. A carburetter comprising a mixing chamber provided with a fuel inlet, two air admission ports, and a delivery port, means actuated externally of the carburetter for varying simultaneously the effective area of all of said ports, and independent means also actuated externally of the carburetter for varying the effective area of one of the air admission ports.

## STODDARD-DAYTON IS MERGED

Officially Taken Over by the United States Motor Co.—Courier and an Engine Plant Also Acquired.

Not only did the United States Motor Co., at the special meeting of the stockholders yesterday (Wednesday), announce officially the acquirement of the Dayton Motor Car Co. and the Courier Car Co., of Dayton, O., but it transpired that the merger corporation also has acquired the Providence Engineering Works, of Providence, R. I., an engine building concern with an annual capacity of between \$2,000,000 and \$3,000,000 in motors, steam engines, turbines and automobile parts. The meeting effected the scheduled raise of United States Motor capitalization from \$16,000,000 to \$30,000,000, divided equally between the common and preferred.

That the merger company will now cease for some time the taking in of new units was brought out in the report of Benjamin Briscoe, the president, to the stockholders. He declares that the company has reached the proportions deemed best for it at present, and is well rounded out in its ability to supply all of its own manufacturing needs. Net earnings for the first six months are several times enough to pay preferred stock dividends for the whole year, with a substantial overflow available for common stock dividends, which appear to be justified on a regular basis in the very near future. The expected business for the year is approximately \$51,000,000, largely of the 48,700 cars which are to be represented in the year's total. The raise in capitalization will provide a large fund of ready cash for operation and for plant improvement and extension, in addition to taking care of the purchase of the Dayton and Providence properties.

Previous to the stockholders' meeting, it was announced that F. D. Dorman, former secretary of the Maxwell-Briscoe Motor

Co., and more recently secretary of the United States Motor Co., has been elected vice-president and general manager of the Maxwell-Briscoe company, with headquarters at Tarrytown, N. Y. Plans also have been announced for doubling the capacity of the Alden Sampson Mfg. Co.'s plant at Pittsfield, Mass., by the addition of a number of new buildings and the installation of \$125,000 worth of new machine tools.

### Thomas Report is "Unauthorized."

All the way from California comes a report to the effect that E. R. Thomas, the veteran motor car manufacturer, is withdrawing from the E. R. Thomas Motor Co., of Buffalo, N. Y., to join more fully in the affairs of the Chalmers Motor Co., of Detroit, Mich., in which he has had an interest from the time the concern started as the Thomas-Detroit Co. Telegraphic inquiry by the Motor World brought from Mr. Thomas the following reply: "The statements are totally unauthorized." Again the Motor World wired, to ask if "totally unauthorized" meant that the reports were untrue, but no further response was vouchsafed.

### Owen to Become a Chalmers Manager.

Percy Owen, vice-president and general manager of Carl H. Page & Co., the New York distributors of Chalmers cars, is to resign these connections on July 1 to become Eastern sales manager for the Chalmers Motor Co., of Detroit, Mich. He will make his headquarters in New York.

### Fire Destroys a Wheel Plant.

The plant of the Ames Bending Co., of Celina, O., making wheels and wood rim parts for automobiles and wagons, was destroyed by fire on the 7th inst. The loss was \$50,000.

### Midland Enters Licensed Fold.

The Midland car now is a licensed product. Its makers, the Moline Motor Co., Moline, Ill., have been granted a Selden franchise by the A. L. A. M.

## WHY THEY "KNOCK" THE INDUSTRY

Investigation of the Animus Actuating its Critics—Suspensions of a Plot—Shrewd Words from Bankers.

Suspicion has arisen that certain financial interest, having quantities of "undigested securities" to dispose of to the large class of moderately wealthy investors and being peevish because the latter are putting an immense aggregate of money into motor cars instead of into the bonds and stocks that are offered, have instituted a concerted "knocking" attack on the automobile business with a view to discouraging automobile buying on the part of the public. In consequence of this suspicion, the grounds for which are numerous, the Motor World has done a little probing of its own among the Wall street haunts where definite knowledge of any such a campaign might be found.

Among the indications pointing to efforts toward checking the impetus of the popular movement for automobile purchase there have been the speeches of the venerable railroad magnate, "Jim" Hill, and the recent outpourings of the ready phials of wrath of the famous Syracuse scold, Chancellor Day. In addition to this, Joseph T. Talbert, vice-president of the National City Bank, of New York City, in a speech before the Texas Bankers' Association, at El Paso, Tex., on May 10, made reference to the magnitude of the automobile business as an evidence of what he described as the "national vice of extravagance," and this incidental reference obtained a wide publicity in newspapers throughout the country.

Far greater in persistence and volume than the speech-making, however, has been a recent flood of formal articles, interviews, editorials and stray paragraphs, dealing with unpleasant aspects of the motor car industry and accusing it of more or less blighting effects on other lines of

business. Bank officials have been quoted at length on the menace of "automobile paper," in the sense of notes or mortgages incidental to people raising ready cash to buy cars, while the trade papers for the different lines of industry have seriously inveighed against the automobile as accounting for whatever slackness or falling off in business their constituencies may be experiencing.

Supplementing this, the traveling men for bond houses and other concerns that find their patronage among those who at times have respectable sums of money at personal disposal, are extremely energetic in urging against the "folly" of buying a car, and where they cannot dissuade, they gravely counsel for postponement until some time in the far distant future. In fact, the attack on the industry has been so widespread and through so many means and channels, as to suggest a combined movement having a possible powerful origin in the financial centers.

"It is not impossible that the automobile industry is being made the subject of deliberate attack by some of the so-called financial interests," declared the first New York bank official whom the Motor World man consulted. "Everybody in the financial district is aware that a large list of securities are being supported in price, not by bonafide investment purchasers, but by banks and others who are responsible for them, and that it must be somewhat galling to see money flowing so readily into the coffers of the automobile manufacturers while it is so scarce, comparatively speaking, in the investment field.

"The interests that are sufficiently powerful to make savings banks reduce their interest rate in order to coax depositors to take their money out and invest it in bonds and other securities, where the return is greater," he continued, "might reasonably be supposed to be capable of wielding considerable influence elsewhere, and of being highly resourceful in their methods. Personally, however, I have no reason to believe that there is any definite campaign on foot, or that there exists any compact of any kind among those whom the automobile business is supposed to be affecting adversely."

Horace M. Kilborn, vice-president of the National City Bank, who is the moving spirit in a concern which is to build the Orson car in Springfield, Mass., is not impressed with the idea that there exists any "conspiracy or general financial antagonism against the automobile industry. His close associations with Mr. Talbert, whose El Paso speech has so aroused the automobile manufacturers, qualify him to disclaim for Talbert any enmity or ill feeling against the motor car makers, and to explain that Talbert's remarks concerning the heavy purchases of automobiles were only intended to indicate one of many items in which Americans evince extravagant tendencies,

in the same way that attention was called to the \$200,000,000 that Americans spend each year in traveling abroad.

"If I thought that the financial interests of the country were against the automobile industry," said Kilborn, "do you suppose for one minute that I myself would go into the building of cars? As a matter of fact, I find that the men with money are more than anxious to go into the automobile industry, and even our modest enterprise has brought offers of far more capital than we want to use for it, from men who are eager to place money in the manufacturing end of the motor car business.

"All the speeches that can be made about the economic wrong that is wrought by people who buy cars when they cannot fully afford to do so, will not change any man's determination to get an automobile if he really wants one. He will regard it as a matter entirely personal with himself, and will not bother about the violations of the broad principles of economics that may be involved. There may be people who feel that they or their interests are being injured by the diverting of so much money into this new and striking industry, and who give expression to their complaints. Others may be struck with certain alarming economic phases of the situation. But I know of absolutely no large endeavor or plot to embarrass or impede the automobile industry.

"When I moved to the country last week for the summer," he continued, "I was given occasion to think that perhaps some of this economic reasoning about motor cars is a little wide of the mark. Seven automobiles followed us from the railroad station to our home, and it developed that they belonged to grocers, butchers and other tradesmen, not to mention some farmers, all of whom were seeking our patronage and all of whom made great capital out of the fact that they could give us immediate delivery by automobile, of such things as we might order by telephone. They all use touring cars, putting the stuff in the tonneau, and the utilitarian value of the machines apparently more than justifies the supposed extravagance in the use of them as pleasure vehicles."

#### Five Men in Legal Fight for Drawings.

In consequence of difficulties arising over the promotion of an automobile manufacturing concern in Toronto, Ont., the police of that city on the 8th inst., arrested Julius Holtenberg, Charles Preston, Arthur J. Greenaway and John Atkinson, all of Detroit, on the joint charge of conspiring to defraud William Midgeley Campbell of Toronto of a number of automobile drawings. The complainant had put \$1,000 in the enterprise and had secured a provincial charter for it as "The Motors, Limited." He claims that while Atkinson engaged him in a conference elsewhere, the other three men called at his office and secured possession of the company's drawings, which were his property. The four men were held in \$500 bail each, the case being remanded until the 16th inst. They claim that Campbell failed to fulfill an agreement to supply \$9,000 more capital in a stipulated time, and that because Holtenberg was the owner and originator of the drawings, the latter were taken to prevent Campbell making duplicates.

**Boston Dealers Select their Show Dates.**

#### Dates have been selected for the Boston automobile show next March, by the Boston Automobile Dealers' Association, which held its annual meeting on the 11th inst. The show is to be in the Mechanics building, as heretofore, and will take place March 4 to 12, 1911. The deliberations of the dealers also resulted in the adoption of a uniform and general rate of 75 cents per hour for repair work on motor cars. At the meeting the old board of officers was re-elected in its entirety, as follows: J. H. MacAlman, president; J. H. Hathaway, vice-president; F. A. Hinchcliffe, treasurer, and Chester I. Campbell, secretary.

**Demotcar's Creditors Favorably Inclined.**

#### Creditors of the Demotcar Co., of Detroit, Mich., who recently appointed a committee of three to investigate the company's affairs and determine the judiciousness of granting time extensions that were asked for, held a second meeting on the 7th inst., to receive the committee's report. As a result of the meeting the creditors have indicated a disposition to grant extensions. A stockholders' meeting was called on the 8th inst., at which \$25,000 is said to have been subscribed to provide further working capital for the concern.

**Paterson Establishes a Canadian Plant.**

#### Lured by the prospects of Canadian business, another Michigan automobile company has arranged to open a factory in Windsor, Ont., which is across the river from Detroit. The Paterson Automobile Co., of Flint, Mich., has secured the Ferriss livery stable buildings, at Pitt and Ferry streets, which will be remodeled as an assembly plant and sales headquarters. T. G. Ferriss will become sales manager of the company for Canada.

**Hupp Reaches Out for Export Trade.**

#### The Hupp Motor Car Co., of Detroit, Mich., is furthering its export campaign by sending abroad Calvin H. Dunlap, assistant sales manager, who sailed from New York on the 11th inst., and who will remain in Europe six months or more. He took with him a Hupmobile which is to be staged at several industrial and trade expositions in European countries during the summer. The trip also will result in the establishment of a number of Hupmobile agencies.

## PURSuing THE PRICE CUTTERS

**Klaxon Makers Get Injunctions Against a Big List—Nine Offenders in Toils, Some for Offering "Premiums."**

Offering the most convincing kind of proof that patents, when their full rights are exercised, are an adequate weapon against price cutters, a list of no less than eight recent permanent injunctions against concerns who have indicated a disposition to cut prices on Klaxon horns has been obtained by the Lovell-McConnell Mfg. Co., of Newark, N. J., which for some time figuratively has been "setting pace" for the accessory trade in regard to price maintenance. These injunctions not only forbid the cutting of prices on Klaxon horns, but forbid the defendants from handling the goods at all, even at full list prices.

Because of the success which has been met with in other lines of manufacturing in the maintenance of prices through the power that is given every patentee to control the vending of the subject of his patent, various makers of automobile accessories have tried, from time to time, to embody the "license" plan in their selling scheme, in order to compel a holding to the prices set. Most of these attempts, however, have been rather half-hearted and have been so loose and incomplete in their application as to have little or no effect.

That the fault has been not with the principle but with the manner of its application is clearly indicated by the continuing series of victories which the Klaxon makers have to their credit, the most recent of which was won last week, and which are having the actual practical effect of keeping their goods free from the depressions of cut-price influence. Since April 6 last the company, through its attorney, George Cooper Dean, 149 Broadway, New York City, has obtained decisions in no less than nine cases, as follows:

Suit vs. Kaufman Bros. of Pittsburg, Pa., terminated April 21, 1910, by a final decree in favor of the complainant, the Lovell-McConnell company, and a permanent injunction against handling the goods was issued on April 23.

Suit. vs. Max Zeisler of New York City, doing business under name of the Imperial Automobile Supply Co., was filed April 23, a final decree signed April 27, and final injunction issued the same day.

Suit vs. American Auto Supply Co. of New York City was filed April 30, preliminary injunction issued May 9, a final decree signed May 23, and a permanent injunction issued May 23.

Suit vs. David E. Hydecker of New York City, doing business under the name of the Empire Auto Supply Co., was filed April

30, preliminary injunction issued May 9, final decree signed May 31, and a permanent injunction issued June 1.

Suit vs. Moto Bloc Import Co. of New York City was filed May 7, preliminary injunction issued May 13, final decree signed May 26, and a permanent injunction issued May 27.

Suit vs. Thomas H. Ramsdell and Edward R. Wood of New York City, doing business under the name of the National Trading Co. jointly with the National Association of Automobile Owners, was filed May 7, a final decree signed May 26 and a permanent injunction issued May 27. In this case the infringement consisted in selling to a member of the owners' association a \$35 Klaxon for \$24. This sum, even with the membership of \$6 added, was only \$30 total cost to the member buying the horn.

Suit vs. National Auto Supply Co. of New York City was filed May 20, final decree signed May 26, and a permanent injunction issued May 27. In this case the Klaxon was sold for the full sum of \$35, but a premium was given in the form of a Thermos bottle, valued at \$4.75, according to the catalog, and also a racing automobile cap valued at \$1.25, giving a total of \$6 to the premium.

Suit vs. Lowe Motor Supplies Co. of New York City, filed May 7, with final decree and injunction on June 6.

In addition to these cases the company has obtained judgment by default, against John J. Tracy of New York City, doing business under the name of the Universal Auto Supply Co., in a suit filed May 30, 1910.

What might be termed the "keystone" of the Lovell-McConnell plan is the comprehensive and rigid license form, details of which were given in the Motor World, issue of December 23, 1909. The license has recently been amended by the addition of the following paragraph: "(4) No license whatever is granted for purchase or sale by anyone who has been notified that he is objectionable to makers; nor for purchase to or through, or sale by or to any person, company, concern or association which offers or affords purchasers or users any membership, profit sharing or co-operative right or privilege."

### Canary Taxicab in Receiver's Hands.

The Dan Canary Taxicab Co., of Chicago, Ill., has been placed in the hands of a receiver by Judge Baldwin in the Circuit Court. The petition of John F. Meyer, a printer, to whom the company owes \$95.95, recites that the company was incorporated on Jan. 7, 1910, with a capital stock of \$10,000, and ceased doing business on June 7, after its capital had been raised in March to \$30,000. It is stated that the company owes \$23,000 and that the assets amount to only \$1,500. John Frady was appointed receiver.

## "RUBBER KING" GOES TO JAIL

**Came from Venezuela, Bought Automobiles and Gave Bad Checks for Them—Steamship Accident His Undoing.**

Employing the magic name of "rubber" to further his operations, an alleged "rubber king" who imposed on two New York automobile dealers might now be safely out of the country except for his bad luck in the choice of a steamer on which to sail. The boat on which he took passage, the Carolina, of the New York and Porto Rico line, hit a barge as she was going out of New York harbor on Saturday, the 11th inst., and was obliged to come back to her dock in Brooklyn, and the "rubber king," instead of journeying away, has had to face a charge of grand larceny.

The "king," Rafael Aranga Morales, of Port of Spain, Trinidad, came to New York City about two months ago, with 28 square miles of rubber plantation in Venezuela to sell. Through acquaintances on the boat he found a prospective customer, who during the wait until Morales could secure from Venezuela the deeds to property, acted as his friend and adviser in personal matters. When the Venezuelan expressed a desire to buy an automobile, his customer, William J. Morrison, referred him to George T. Eastment, an automobile dealer on West 35th street. There Morales picked out a \$1,250 car and ordered it put in shape for him. While he was waiting for the car and Eastment was waiting to see a check covering the value thereof Morales ran up \$150 in automobile hire and then Eastment lost track of him.

Harry E. Phelps, who is the president of an automobile concern at 1937 Broadway, was the next person with whom the rubber planter did business. Morales looked over Phelps's stock and picked out an \$1,100 car on June 7. He ordered it painted another color and his order was followed. On Monday of last week Morales visited Phelps and paid him on account a check for \$600 on the Trust Co. of America and borrowed \$35 in cash from Phelps. On the following day Morales dropped in on Phelps and asked if he had already cashed the check given to him the day before. When Morales learned that Phelps still had the check he asked that it be returned to him and one for \$300 be accepted instead. Phelps agreed to this and after Morales had torn up the first check and written the second, also on the Trust Co. of America, Morales borrowed \$45 more from Phelps.

Phelps sent this second check to the trust company on Wednesday and it was returned stamped "No Funds." That was the last the automobile man saw of the rubber planter for a few anxious days.

**THE WEEK'S INCORPORATIONS.**

Detroit, Mich.—Triumph Motor Car Co., under Michigan laws, with \$100,000 capital.

Sauk Center, Minn.—Sauk Center Garage, under Minnesota laws, with \$50,000 capital.

Erie, Pa.—American Motor Sales Co., under Pennsylvania laws, with \$10,000 capital, to deal in automobiles.

Chicago, Ill.—Calumet Motor Club, under Illinois laws, no capital. Corporators—R. J. Ton, G. H. Sternberg, Ernest Biehl.

Chicago, Ill.—Shaw-Merillat Co., under Illinois laws, with \$10,000 capital. Corporators—H. I. Shaw, E. R. Bliss, Jr., Lloyd Merrillat.

Beaumont, Tex.—Standard Auto Co., under Texas laws, with \$3,000 capital. Corporators—C. J. Chaise, Harry McKee, C. W. Putnam.

Denver, Col.—Denver Regal Auto Co., under Colorado laws, with \$10,000 capital. Corporators—J. E. Lambert, C. R. Lambert, F. N. Haines.

St. Louis, Mo.—Maefor Motor Car Co., under Missouri laws, with \$15,000 capital. Corporators—R. L. Maefor, W. T. Little, Geo. S. Foster.

Denver, Col.—U. S. Puncture-Proof Tire Co., under Colorado laws, with \$50,000 capital. Corporators—Gustav Fuenfstueck, Jos. Halbekann, L. Frisch.

St. Louis, Mo.—Beguelin-Buschart Motor Co., under Missouri laws, with \$5,000 capital. Corporators—Charles and Edward Buschart and Henry Beguelin.

Worcester, Mass.—D. A. Baldwin Automobile Co., under Massachusetts laws, with \$10,000 capital. Corporators—D. A. Baldwin, A. O. Wheeler, Wm. Woodward.

Watertown, N. Y.—Gray Automobile Co., under New York laws, with \$500 capital; to deal in automobiles. Corporators—C. W. Gray, Carrie Gray and Florence Gray.

Milwaukee, Wis.—W. S. Seaman Co., under Wisconsin laws, with \$50,000 capital, to manufacture automobile bodies. Corporators—H. H. Seaman, I. Seaman, K. D. Seaman.

Detroit, Mich.—Evans Motor Car & Parts Co., under Michigan laws, with \$30,000 capital, \$15,000 of which is paid in. Corporators—R. H. Evans, W. A. Farlinger, S. E. Lockwood.

Camden, N. J.—Lorraine Motor Co., under New Jersey laws, with \$60,000 capital, to manufacture automobiles, motorcycles, etc. Corporators—F. H. Hansell, J. A. McPeak, W. F. Eidell.

Nashville, Tenn.—Southern Motor Works, under Tennessee laws, with \$400,000 capital, to manufacture automobiles. Corporators—A. H. Robinson, E. Burkitt, H. Buttorff, and others.

Buffalo, N. Y.—Clark Motor Co., under New York laws, with \$50,000 capital, to manufacture automobiles, motors, engines,

etc. Corporators—S. B. DeLong, J. W. Van Allen, H. J. Rente.

Atlanta, Ga.—Primo Motor Co., under Georgia laws, with \$200,000 capital, to manufacture motor cars. Privilege of increasing capital to \$500,000. Corporators—E. Van Winkle and others.

Binghamton, N. Y.—Binghamton Taxicab Co., under New York laws, with \$5,000 capital, to do general automobile and transfer business. Corporators—E. V. Dunn, A. L. Dunn, W. O. Boughton.

Brooklyn, N. Y.—Mack Brothers Motor Car Co., under New York laws, with \$25,000 capital, to manufacture and deal in automobiles and accessories. Corporators—Wm. C. Mack, W. J. Groves, W. F. Buchheit.

New York City, N. Y.—Car Makers Selling Co., under New York laws, with \$10,000 capital, to manufacture and deal in automobiles and appliances. Corporators—George L. Dorr, Jas. L. Clark, Donald M. Miller.

New York City, N. Y.—Autofactors Corporation, under New York laws, with \$2,000 capital; to manufacture and deal in automobile specialties and accessories. Corporators—E. J. Forhan, G. F. Martin, H. P. Jones.

Lewiston, Mo.—Warning Signal Lamp Co., under Maine laws, with \$500,000 capital, to manufacture and sell automobile vehicles and all parts and accessories thereof. Corporators—R. S. Buzrell, M. M. Farrar.

New York, N. Y.—Bushey Demountable Rim Co., under New York laws, with \$20,000 capital, to manufacture and deal in automobiles, parts and accessories. Corporators—G. B. Lambert, E. J. Bushey, F. J. McCoy.

New York, N. Y.—Auto Trunk Rack Mfg. Co., under New York laws, with \$900 capital, to manufacture and deal in automobile trunk cases, racks, and accessories. Corporators—Hyman and Chas. Goldstein, Benj. J. Laxer.

Rochester, N. Y.—Campus Auto Garage, under New York laws, with \$10,000 capital, to manufacture and deal in automobiles, bicycles and supplies. Corporators—E. A. Stein, James Barry, H. B. Shield, all of Rochester, N. Y.

Rockland, Ill.—John Deere Plow Co., under Illinois laws, with \$250,000 capital, to deal in implements, vehicles, automobiles. Corporators—Wm. Butterworth, Schiller Hosford, Geo. W. Mixer.

Detroit, Mich.—Detroit Airless Tire Co., under Michigan laws, with \$1,500,000 capital, successor to Dayton Airless Tire Co. New corporators—S. O. Johnson, W. Brotherton, F. C. Van Dyke, Geo. C. Clark, C. McMillan, and Col. J. C. Hooven.

Flint, Mich.—Fleetwood Engineering Co., under Michigan laws, with \$30,000 capital, re-organized and articles of incorporation amended. C. W. McClure, J. D. Mershon,

and W. T. Foley, all of Saginaw, Mich., have entered the company.

Mt. Clemens, Mich.—Mt. Clemens Garage & Auto Sales Co., under Michigan laws, with \$25,000 capital, to operate and sell automobiles. Corporators—C. S. Ferrin, R. J. Stewart, S. J. Dalby, B. R. Erskine, O. C. Lungerhausen, A. W. Schott, S. C. Price.

Detroit, Mich.—Automobile Mfg. & Engineering Co., under Michigan laws, with \$1,000 capital, to manufacture automobiles and self propelled vehicles, "both on land, water and air, or either of them." Corporators—C. M. Miller, H. L. Booth, S. S. Allen, all of Plattsburgh.

**Increases and Decreases of Capital.**

Pontiac, Mich.—Oakland Motor Car Co. increases capital from \$200,000 to \$800,000.

Saginaw, Mich.—Marquette Motor Co. increases capital from \$300,000 to \$800,000.

Detroit, Mich.—Detroit Auto Specialty Co. increases capital from \$50,000 to \$75,000.

Cleveland, Ohio.—Cleveland Electric Vehicle Co. reduces capital from \$300,000 to \$50,000.

Detroit, Mich.—Detroit-Dearborn Motor Car Co. increases capital from \$100,000 to \$250,000.

Grand Rapids, Mich.—Sintz-Wallin Co., manufacturers of gas engines, increases capital from \$60,000 to \$90,000.

Milwaukee, Wis.—Briggs & Stratton Co., manufacturers of automobile specialties, increases capital from \$25,000 to \$50,000.

**Twenty New Members on Engineers' Roll.**

Twenty new members have been added to the Society of Automobile Engineers, according to an announcement this week by Coker F. Clarkson, the recently appointed general manager of the organization. The new members are as follows: David Dwight Rowlands (Rider-Lewis Motor Car Co.), Clarence W. Spicer (Spicer Manufacturing Company), Christian Girl (Perfection Spring Co.), Arthur Holmes H. H. Franklin Manufacturing Co.), Marcus Thompson Lathrop (Halcomb Steel Co.), Henry C. Wilson (Sub-Target Gun Co.), C. E. Reddig (Columbia Motor Car Co.), Joseph P. Lavigne (Lavigne Mfg. Co.), Edward R. Hewitt (Hewitt Motor Co.), Tracy Vere Buckwalter (Pennsylvania Railroad), H. P. Dodge (Ohio Electric Car Co.), H. C. Colburn (Colburn Automobile Co.), Irving W. Adams (High Frequency Ignition Coil Co.), John A. Mathews (Halcomb Steel Co.), W. H. Cameron (Willys-Overland Automobile Co.), Charles Archibald Ward (Pittsburg Motor Car Co.), Lars G. Nilson (Nilson-Miller Co.), Hugo C. Gibson (Requa-Gibson Co.), George Kearney Bradfield (Vacuum Oil Co.), and William Fleming Abel (Halcomb Steel Co.).

## IN THE RETAIL WORLD.

T. T. Brown, of Lulig, Tex., is building a garage. J. H. Appelt is doing likewise in Hallettsville, Tex.

Lawton, Okla., is to have another garage on D avenue where the McDuffy Co. is building a one-story establishment, 140 x 50 feet.

Harvey C. Garber is building a garage at 1509 East Broad street, Columbus, Ohio. It will be of brick, one story high, and cost \$1,000.

The Hermitage Auto Co. has established a garage and salesroom at 145 Third avenue, north, Nashville, Tenn. Cole cars will be sold.

The Wear-Mulvane Motor Car Co. has moved into new salesrooms at Kansas avenue, Topeka, Kas. The new store is 125 feet deep and 25 feet wide.

Edgar Ely, a hotel proprietor of Elgin, Ill., has opened a garage and repair shop for automobiles in Kirkland, Ill. He will not act as agent for any car.

Edward J. Welch is building a two-story cement garage at Lunenburg and Compress streets, Fitchburg, Mass. It will be 60 x 80 feet and will cost about \$5,000.

Cummings & Eddings, Marlin, Tex., carriage and implement dealers, have "taken on" automobiles. They are handling E-M-F, National, Knox and Pullman cars.

John Proctor is the projector of a garage which is being built at the corner of Chapel Hill and Foster streets, Durham, N. C. The building will be one story, of brick, and will cost \$2,500.

The Fulton Motor Co., with headquarters at 34 Auburn avenue, Atlanta, Ga., has changed hands. J. B. McCarthy, for six years connected with the Fiat agency in New York, is the new owner.

The Eureka Motor Car Co. of St. Louis, Mo., has changed its name to Eureka Auto Parts Mfg. Co., and will manufacture radiators. It will, however, retain the agency for the Empire "20" runabout.

D. Rees Davis has purchased an interest in the Houseman-Blake Automobile Co., at 5037 Delmar avenue, St. Louis, Mo. The name of the company in the future will be the Davis-Blake Automobile Co.

The Sweet-Edwards Co. is the style of a new concern which has invaded the automobile field of Omaha, Neb. Ernest Sweet, the senior partner, is a real estate man. R. A. C. cars form his "stock-in-trade."

The corner of Market and Church streets, Poughkeepsie, N. Y., has been purchased by John Van Benschoten, the veteran dealer, who will erect a garage thereon. The building, when completed, will cost about \$45,000.

The Imperial Motor Co. is the style of a new concern composed of J. S. Frazer and Banks Bennie which has opened up at

112-114 Third avenue south, Nashville, Tenn. Packard automobiles are to be handled.

Under the style the Chisholm Sales Corporation, a number of prominent men of Buffalo, N. Y., have opened a large automobile salesroom and garage at 730 Main street. National, Speedwell and Locomobile cars will be handled.

J. C. Ross, J. E. Ross and E. G. Oppen have leased the Martin building on East Main street, Independent, Kan., and opened a garage. The members of the firm are in the plumbing business and will conduct the automobile garage as a side line.

The Toledo Garage and Supply Co. has entered the automobile business, with headquarters at 713-715 Jefferson avenue. Renting and accessory supply departments will be conducted in connection with the general work of a garage and repair shop.

A. Kuhnelt and F. W. Martin have opened a repair shop, under the style of the Toledo Auto Tire Repair Co. at 240 Erie street, Toledo, Ohio. Martin has been connected with the Morgan & Wright Co., while Kuhnelt formerly was on the Firestone staff.

Accessories and supplies will be featured by the Merriman Brothers Automobile Co., Memphis, Tenn., which just has been formed. The company has the agency for the Thomas Flyer and National cars, and intends to establish a mail order accessory business.

The W. M. P. Motor Co. has begun business at 1993 Broadway, New York. L. R. Walton, former president of the Standard Auction Co., is president, while L. R. Moody, formerly with the Mercedes Direct Agency, is general manager. Abbott-Detroit cars will be featured.

At Fifth street and Seventh avenue, Minneapolis, Minn., N. M. Majerus is building an automobile garage to cost \$20,000. The building will be two stories in height, of reinforced concrete with pressed brick and plate glass front, 95 feet wide and 170 feet long, and will accommodate 120 cars.

What is heralded as "the finest garage in the Northwest" has been opened at 13th street and Nicollet avenue, Minneapolis, Minn., by the MacArthur-Zollars Motors Co. The concern is the northwestern distributor of Everitt "30," Anhur "6," Black Crow, Amplex, Corbin and the Babcock electric cars.

Two new links in the chain of garages which the Kingsboro Co. is establishing in Brooklyn have been finished, one at 109 Sterling Place, and the other at 396 Fifteenth street. F. W. Heinmann is president of the company, while his son, C. L. Heimann, is in charge of all the mechanical departments.

What is claimed by its owner, W. J. Tynan, to be the most up-to-date garage

in New Jersey just has been opened at 175-177 Van Houten street, Paterson, N. J. The building, which is 100 x 50 feet, embodies a novel idea in ventilation which is said to greatly lessen the danger of gasoline vapor explosions.

The New Amsterdam Motor Co., of 152 West 56th street, New York City, is in financial straits, Judge Hough having named Jesse Watson as receiver in bankruptcy. The assets are estimated at \$10,000, but no estimate is given as to the liabilities. It is stated that on June 6 the Crawford Automobile Co. took away several cars, claiming they were its property.

Gilmour & Fear, automobile dealers at 846 Woodward avenue, Detroit, Mich., have dissolved partnership by mutual consent. Charles G. Gilmour, who is the Mitchell agent, bought out C. B. Fear's interest in the concern and will continue the business at the same location under his own name. C. B. Fear, who has the Krit agency for the city of Detroit, has not decided as yet where he is going to locate.

The Genesee Garage is the style of a new establishment which just has been opened at 364 Genesee street, Utica, N. Y. It is 72x100 feet, built of artificial stone, electrically lighted, steam heated and contains a repair shop, 28x72 feet. Walter E. Johnson, the owner and manager, formerly was manager of the Oneida Garage. He handles the Whiting, Oakland, Marmon and Royal Tourist products.

Fire originating in the garage of the Central Automobile Co., on South Main street, Dayton, Ohio, caused \$3,000 damages before it could be extinguished. The building sheltered, beside the Central company, the Dayton Taxicab Co., the E-M-F agency, Blackburn agency and the J. R. Reedy Repair Co. The forty automobiles stored in the building were removed in time, and only a few of them suffered slight damages. Explosion of gasoline vapors is given as the cause of the fire.

## San Francisco Dealers Again Get Together.

After a long period of suspended animation, the organization of automobile dealers in San Francisco, Cal., has been rejuvenated with a view to bringing all of the local trade into full harmony. At a meeting held in the rooms of the San Francisco Motor Club, on the 2d inst., the old officers resigned, and a new board of directors chose officers as follows: L. V. Lynch (Speedwell), president; John F. McLain (Franklin), vice-president; C. S. Richardson (Knox), secretary; W. L. Hughson, (Standard), treasurer. The name is to be changed from the Automobile Dealers of California to the Automobile Dealers' Association of San Francisco. "We have all had our lesson," the retiring president explains, "and the thing to do is to work in harmony."

# WHITE GASOLINE CARS

## for 1911

**SIZE AND POWER**—moderate, therefore, most economical to maintain.

**PRICE**—moderate, therefore, easy to buy.

**DESIGN**—includes many advanced features not found in any other American car.

**QUALITY**—The only moderate sized car wherein every part is just as well built as in the highest-price, high-powered cars.

**DELIVERY**—Very few open dates. First come, first served.

"Enclosed find draft for the renewal of my subscription for the Motor World. I regard it as one of the best publications on motor subjects."—Austin McMichael, M.D., Rock Port, Mo.

#### Effects of the Bogus Stock Car Rule.

It is not strange that the American Automobile Association's half-hearted effort to define a stock car has not only met with failure but given rise to ill-feeling and opposition.

The very rules themselves constitute a gross contradiction. In one breath they state that "it is the intention of the rules relating to stock cars and stock chassis competitions that such competitions shall be restricted to those cars identical in specification, materials and design with the manufacturer's product which is manufactured in quantity and is offered for sale and sold in a bonafide manner to the public through the regular selling agen-

cies of the manufacturer." In another breath and putting the word "identical" to rout, the rules catalog a long list of "Options Permitted," which are so remarkably generous as to sanction and encourage, if they do not actually invite, the alteration of everything save valves, frames and wheels, and leave all manner of loopholes through which anyone so disposed may crawl. It is not wholly an unnatural order of things that there should be those who have accepted and made the most of the invitation. The "doctored" cars that have resulted are in such a degree identical with those "sold over the counter," so to speak, that purchasers of the latter scarcely can be blamed for not recognizing them when they see them.

In a sport so thoroughly commercialized and having permitted commercial interests to dominate its actions, it is in no wise remarkable that the A. A. A. should have difficulty in shaping a straight course and should so often be forced to steer into the harbor of expediency which notoriously is full of rocks and shoals and which is the usual refuge of all who fear or desire to escape fulfillment of a plain duty.

If, as they state, it is the intention of the rules that a stock car shall be identical with those purchasable by any person, let the intention be adhered to and without such subterfuge as is afforded by options of any sort which give the lie to the "intention." If desire to enforce the rule truly exists, let the most be made of the suggestion that any car competing in a stock car event shall be purchasable at the list price fixed by the catalog. If it truly is "identical in specification, material and design" with his other cars, the manufacturer should be as willing and as anxious to sell it on the track or road as in his salesroom.

#### Concerning the Convertible Body.

Despite the great amount of attention which has been paid to every factor in the construction of the modern motor car it is a somewhat curious fact that the truly convertible body has not attained the popularity that so frequently has been predicted for it. This is not because of any apparent misconception of its value in a theoretical way. There is every reason to believe that for a large class of users, the car which could be applied either to two or four passenger carriage and to enclosed and open

use, and also could be adapted to the transportation of small amounts of luggage would be extremely useful; that once its construction has been rendered practical and reasonably low-priced, a considerable demand would arise for it. The real reason for its slow development is to be found, in all likelihood, in the absorption of practically all automobile manufacturers in the business of production rather than of development along radical lines. For this circumstance, obviously, no one is to blame.

Nevertheless the desirability of the convertible vehicle for certain uses remains an undisputed fact. Several builders realizing this now are engaged in producing machines which answer to one or two of the demands which the idea of convertibility so readily suggests. Nor is there any great difficulty in achieving fairly satisfactory results where the effort is outlaid along the lines of the cheaper grade of product. With a simple tray body, suitable for hauling trunks and other light loads, one or two cross seats may be employed, while a demountable top for such a vehicle readily may be fashioned. Such machines are to be found on the lists of a number of builders, and there is reason to believe that their judgment in producing them is both sound and wise.

It is the owner of more ample though not unlimited means, who sometimes would prefer to drive his own car, sometimes would prefer to travel in state with a paid driver, who on certain occasions desires an open conveyance and at others one which affords ample protection from the elements; who really is in need of a form of car which at present the market does not afford. In the two-passenger inside-driven coupe is found an ideal rough weather car, which appears to be gaining in vogue. In a few foreign designs the idea is carried even further in employing a form of folding top, closely resembling in purpose that of the landaulet. This is well enough in its way, though it still lacks the ideal of convertibility, while it affords no means for adding to the passenger carrying capacity. In the conventional runabout and roadster is another approximation to the ideal of flexibility in accommodation, though the desirable feature of flexible protection against changing weather conditions is not readily achieved.

So although practically all the elements which it might be thought would be de-

sirable in combination are found singly or in pairs, the successful combination of them all yet remains to be developed in a single body. That it is a practicable undertaking to design such a body is a matter of no question. The thing to be deplored is that so few makers have the leisure to devote the necessary time to its evolution. It is practically certain that there would be a good market for such a vehicle if well put together and up to the mark in chassis construction.

#### Dealers' "Gifts" Cause of Evil.

Those who concern themselves with the stopping of waste in the trade machinery are beginning to take note of the evil effects of the habit of patronage into which many retail dealers are falling. In some cases even the practice has gone beyond the limits of the individual offense and degenerated into a custom; occasionally to be miscalled a bright and clever method of business getting. But whether regarded in the light of a personal matter between seller and buyer, a productive investment or a necessary evil, the fact remains that the element of personal graft extorted from the dealer under pretext of accelerating trade amounts, in the aggregate, to a good round sum and spells net loss to the industry.

It is a pleasant custom to add a bit of extra discount, throw in an ounce or two of some commodity over and above the exact requirement or pass out a "sample" spark plug or a wrench in recognition of an unusually large sale. It pleases the customer, tends to make him come again, and reflexes warmly back upon the salesman, who is made to feel that he has accomplished a worthy deed. The logical extension of the principle is not foreseen ordinarily, however. What brings the customer back the second time is quite as likely to be the prospect of a souvenir as any particular appreciation of the merit of the goods. As naturally is to be expected, the ultimate result of the practice may be to induce the first "friend" made in this way to bring other "friends" until the dealer's entire trade calls him by his first name and looks for excuses to come in and gather the easy plunder.

Expanded into the form of a system, the practice may be dignified by the title of a premium scheme and may verge pretty closely upon the legitimate, if sometimes

## COMING EVENTS

June 14-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 16-22, Albany, N. Y.—Albany Automobile Club's sixth annual tour to Atlantic City, N. J., and return.

June 17, Memphis, Tenn.—Automobile races at Tri-State fair grounds; postponed from May 21.

June 17-18, Buffalo, N. Y.—Automobile races at Fort Erie track.

June 18, Newark, N. J.—New Jersey Automobile and Motor Club's 280 miles reliability run; postponed from 11th.

June 18, Wilmington, Del.—Delaware Automobile Association's roadability run.

June 18, Ossining, N. Y.—Upper Westchester Automobile Club's annual hillclimb.

June 18, St. Joseph, Mo.—Automobile Club of St. Joseph's sociability run.

June 18, Baltimore, Md.—Automobile Club of Maryland's hillclimb.

June 18, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 20-23, Des Moines, Ia.—Iowa Automobile Club's endurance run.

June 22-25, Minneapolis, Minn.—Automobile races at state fair grounds.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

June 25, Yonkers, N. Y.—Upper Westchester Automobile Club's race meet at Empire City track.

June 28-30, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' Association's endurance run for "Star" trophy.

June 30, Winnipeg, Man.—Winnipeg Automobile Club's annual tour; 455 miles.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 2-4, New York City—Touring Club of America's sociability-guessability run to Waterbury, Conn., and return; 200 miles.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

July 4, Muskegon, Mich.—Gentlemen's Driving Club's automobile race meet at Driving Park.

July 4, St. Paul, Minn.—Minnesota State Automobile Association's race meet.

July 4, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

July 4, Auburn, N. Y.—Auburn Automobile Club's hill climb.

doubtfully productive, method of the advertising competition. More commonly it does not progress beyond the stage of pure graft; the bonus offered for influence or fancied influence and entailing no fixed or commensurate reward. Thus dealers in some localities are offering sets of tires in return for the introduction of new customers by their old ones; accessories pass lightly across the counter in the same free and easy manner, while in other cases the inducement takes the form of credit memoranda for the repair account, good for surprisingly large amounts.

Just what the aggregate loss to the trade from this cause amounts to cannot be told. In England, where the dignity of the peerage cloaks many a barefaced holdup, the evil has assumed proportions which are recognized as dangerous. Because of the big outlay in rakeoffs to titled "touts," who claim their commissions as brazenly as does the American chauffeur, dealers in some cases have been forced to raise the prices to almost prohibitive amounts. In others, they have been forced to suffer the

loss in silence, on penalty of losing prestige with the more or less influential hangers-on. It is only a few days since S. F. Edge, who seldom is silent on any topic even remotely connected with motoring, voiced the opinion that about four million dollars has been spent in needless commissions out of a yearly total profit of fifty-five millions.

Though lacking any organized method of kowtowing to patronage in this country, it is a deplorable circumstance that through misconception of the principle, laxity or fear of the consequences, a large number of American dealers in one branch of the industry or another are submitting to a needless drain upon their resources. Whether in the friendly extension of credits beyond reasonable limits, the offering of premiums to individuals, the tendering of costly favors or the giving of out and out commissions, the net result is a shrinkage of profits. To the extent that it represents an outlay for which there is no justly recognizable offset, it is indefensible.

# ONLY 24 STARTERS IN GLIDDEN TOUR

Four Late Withdrawals Reduce the Already Small Number—Long Journey Begins Auspiciously but a Fatal Accident Mars First Day and Vile Roads on the Second Day Cause Wholesale Penalizations.

## THE 24 COMPETITORS THAT STARTED.

### For the Glidden Trophy.

Car No.	Name of Car	Price	Driver	Observer
1	Premier	\$3,400	Ray F. McNamara	Robt. A. Hamilton
2	Premier	\$2,500	Chas. L. Ballinger	Walt. W. Lorenz
3	Chalmers 30	\$1,600	Joe Gardham	H. E. Frederickson
4	Chalmers 30	\$1,600	Joe Matson	Joe Mahl
5	Chalmers 30	\$1,600	Bill Bolger	F. J. Regner
6	Cole 30	\$1,500	Harry Knight	R. A. Dewit
7	Maxwell	\$1,500	H. E. Walls	A. D. Rea
8	Cartercar	\$1,800	W. C. Mahoney	C. M. Babbitt
9	Parry	\$1,485	L. M. Dull	J. J. Towers
10	Glide	\$2,500	Fred Castle	L. C. Wheeler
11	Ohio 40	\$1,850	J. W. Stockard	Sidney Black
12	Ohio 40	\$1,850	Ben Hillock	B. D. Arthur
14	Pennsylvania	\$4,500	Morris O'Donnell	
15	Cino	\$2,250	Walter Donnelly	Wm. F. Meyer

### For the Chicago Trophy.

110	Lexington	\$2,880	E. O. Hays	Geo. O. Tebbis
111	Westcott	\$1,900	C. C. Bevington	Fred. Weiser

The non-contestant division is made up of two Cadillac gun-carriages or "balloon destroyers" entered by the Northwestern Military Academy of Highland Park, Ill., a Westcott "40," entered by the Henderson Motor Sales Co.; a Rapid truck and two tire cars, one each from the Diamond Rubber Co. and the B. F. Goodrich Co.

The official cars are a Columbia, occupied by Referee Whiting, Chairman Butler and M. C. Reeves; a Reo, occupied by Secretary Ferguson and J. W. Gogarn; a Chalmers, occupied by D. H. Lewis, as pilot, and James Riker, and five press cars—a Chalmers, a Great Western, a Halliday and two Cuttings.

## Gathering of the Clan at Cincinnati and Some of the "Doings"

Cincinnati, O., June 13.—Old Cincinnatus hardly looked up from his plow to notice the presence "in his midst" of the 1910 National Reliability Tour of the American Automobile Association, more commonly known as the Glidden Tour. Flags were out and "Welcomes," but they were for the United Commercial Travelers, lately in convention here. But for the cars parked in Government square and more cars lining the curbs before the Gibson House, the official headquarters of the contest board, there was little to indicate that the seventh tour and sixth annual contest for the Glidden and Chicago trophies was assembled here preparatory to the start of the longest tour and by far the hardest test ever attempted under the auspices of the A. A. A.

The Automobile Club of Cincinnati endeavored to make the Gliddenites feel at home, and gave an informal reception at the club rooms in the Gibson House Saturday evening. President Charles L. Bonifield, M.D., and his associates on the board of governors served the early arrivals with a Dutch lunch and a vaudeville entertainment, and there were things doing until morning. But the officials of the tour had not arrived, and not more than a score of the entrants, so it was not regarded as a function for the entire tour. And last night the Cincinnati Automobile Dealers' Association entertained the visitors with a special concert at the Zoo. This noon the Automobile club took charge of the visitors again and entertained them with a barbecue at Coney Island. The crowning

function was the banquet at the Automobile Club rooms this evening.

F. E. Edwards, Berne Nadall and David Beecroft, Chicago, and A. L. McMurtry, New York, began the technical examination of the cars in Government square yesterday morning. They inspected the tools, inventoried the spare parts, checked up the sag of the springs and axles, and noted whether the tires were of the regulation size advertised for stock cars. Today they completed the task, and affixed the stamp to the cylinders.

At 4 o'clock yesterday afternoon referee A. H. Whiting expounded obscure points in the rules for the benefit of the drivers. The principal points made clear were that tackle, axe and shovel may be carried; that motors may be stopped at any time without penal-

PENDLETON'S CARTERCAR CONTESTING CHICAGO TROPHY

LANDSHEFT'S CARTERCAR ALSO PURSUING CHICAGO TROPHY

ization except when changing tires; that covers of gasoline tanks and radiator caps will be sealed; that controls shall close one-half hour after the time scheduled for the arrival of the last car, and cars arriving after that time must report an hour before starting time in the morning; that drivers must not rely upon observers for information as to routes or penalizations; that in case of the involuntary stopping of a car on account of mechanical or ignition troubles, the penalized time shall begin upon the stopping of the car and shall continue until the car is again in motion, and that in case of a voluntary stopping for the purpose of doing work, the penalized time shall begin upon the breaking of the seal of the tool bag by the observer and shall continue until the tools are replaced in the official bag; that an overtaking car which is traveling faster than a car overtaken may not drop into a slower pace after passing the other, but must continue at the pace by which it passes until it is a reasonable distance beyond the overtaken car; that extra supplies of oil and gasoline may be carried, but that such supplies may not be used without penalization until after the car has covered one hundred miles on a control; that recharging or replacing of storage or dry

batteries will be allowed at any time without penalty, but all work done in connection with this must be done in the presence of the observer; that only such adjustments of carbureters may be made as can be accomplished without removing or disassembling the carbureter; that special mud aprons may be repaired, renewed or replaced during running time without penalization, and that spring windings and shock absorbers may be used without penalization for trouble with them.

That this is to be a Gliddenless tour, with all the absence of the wonted formalities and functions incidental to all former tours when Charles J. Glidden was present, was realized when a telegram arrived yesterday announcing to Chairman Butler that Mr. Glidden could not go on the tour this year. Business reasons were assigned as the cause of his absence. Mr. Glidden had made the usual arrangements to accompany the tour, even to reserving a seat in Chairman Butler's car, and it was accepted that he would be on hand to receive the yearly tribute of plaudits from the populace like a Mandarin progressing through Mongolian provinces. The telegram yesterday was the first intimation that the wonted kowtows will be cut out. The little levees

and receptions at village and crossroads stopping points, the waving of the flag to applauding multitudes in speeding through large cities, and the addresses and interviews at night controls were picturesque features of former tours that will be missed, and besides, it is generally appreciated that Mr. Glidden was everywhere a strong influence for good roads.

The end of what they facetiously term the "despotism" of Hower was celebrated by the "insurgents" yesterday. The comparative mildness of Chairman Butler in handling all matters under his charge, his deference to the suggestions of others, and his willingness to let others monopolize the spotlight are commended highly by the "insurrectos," but at the same time they have called a meeting for today at which they will demand that reports of each day's run shall be given out daily within a half hour after the scheduled time for the last car to arrive.

Chairman Butler may have felt like a hen with only one chicken when he looked over the caravan of cars that are to follow him through this long tour this afternoon. The Buick and Oakland entries have been withdrawn, leaving 26 contestants to make the journey of 2,851 miles—14 in the Glidden

BALLINGER'S PREMIER AT AN "OLD KENTUCKY HOME"

McNAMARA'S PREMIER "SIX" AT LEXINGTON

division and 12 in the Chicago; there also are six cars in the non-contesting division and eight in the official "retinue," a grand total of 40. In this day when there are about 150 cities producing about 300 makes

of cars distributed among 24 states, the array for the tour could not have impressed the chairman of the contest committee as very impressive or even representative for the classic American touring event. And

of the entries but two are eastern brands—the Maxwell and the Pennsylvania, not to mention the Columbia, which will serve as an official car. Even the Pierce-Arrow, the trophy holder, is among the missing.

## First Day—Good Roads and Picturesque Scenes in "Old Kentucky"

Louisville, Ky., June 14.—The Gliddenites are on their way. They arrived here tonight, but not all of them with perfect scores.

The penalizations of the day as far as made up to the scheduled hour of closing are as follows: Chalmers No. 4, two points for adjusting a brake rod; Cole No. 6, 30 points for cleaning a clogged gasoline feed pipe; Parry No. 9, 3 points for taking gasoline after leaving Lexington; Pennsylvania No. 14, 72 points for solder and pump and late arrival at Louisville; Falcar No. 106, 60 points for replacing magneto; Lexington

miles of Louisville, in essaying to pass the Moline, No. 100, driven by C. H. VanDervoort, Martin crashed in to a horse and buggy, driven by Dr. L. D. Mason, of Middletown. The Cole wrecked the buggy and broke its own right wheel, putting it out of the contest at the very start. Martin and had to pay for the damage to the doctor's rig and saw himself forced out of the tour without a run, so to speak, for the \$300 entrance fee.

This was a small matter, however, in the day's story, in comparison with the death resultant from an instance of apparently

pavements made driving slow and hazardous. Immediately upon gaining Covington, across the muddy Ohio, the roads improved, and the Gliddenites verified for themselves the poet's statement that "the sun shines brightly on our old Kentucky home," and the darkies were apparently gay. Thirty of them were counted around one small muddy pond fishing for bullheads. Curiously enough, the name of the place was Walton.

The roads were strewn with loose rubble, and in many instances with sharp broken stone that cut the tires. This caused a lot of tire trouble during the day's run. Five cars sustained punctures in their right rear wheels. The Maxwell had to change all four of its tires.

In general, however, the roads were good. The Georgetown pike, built before the civil war, and recently sprayed with oil, was splendid and afforded a chance to try out what speed was in the machines. The Frankfort pike was another delight. It was as smooth as ribbon in the midst of a characteristic Kentucky landscape. The odors of locusts and rambler roses in every dooryard allured those on the tour accustomed to city smells. There were little log cabins in the lanes and the dells just as the songs have described them. Old women sat in the doorways and smoked pipes. Historical interest abounded in passing through the points famous in the civil war and retraced the routes of the armies struggling for the possession of Cincinnati, Lexington, Frankfort and Louisville.

It was a holiday along the route through all Kentucky. The cities were filled with people assembled to see the caravan.

The country roads also mustered groups at every cottage and cross roads. Quaint vehicles drawn by quainter animals were in the fence corners. A mule in the highway paced the Moline driven by C. H. VanDervoort two miles at a rate of nearly twenty miles an hour before he was headed.

At the start from Cincinnati the tourists were presented with bottles of whiskey. At the noon stop at Lexington each tourist received another small bottle from the automobile club of that place. Versailles had a banner across the entrance of the town "Welcome, Glidden Tourists," and another at opposite end, "Good Luck."

The students of the Northwestern Military Academy accompanying the tour with balloon destroying guns mounted on the Cadillac cars are doing routine work except in a little different form. They are

THE NORTHWESTERN CADETS AND THEIR "BALLOON DESTROYER"

No. 110, 4 points for replacing a brake rod pin, and Westcott No. 111, 6 points for three different adjustments of the carburetter.

Cincinnati turned out so strong to see the start of the tour that the police had difficulty in keeping a way open for the machines. It was 8:30 o'clock before Starter Ferguson sent the first car off. L. R. Speare, president of the A. A. A., was present to lend his official dignity to the occasion. The morning was fair and the auspices generally were all that could be desired.

A. L. Martin, driving the Cole runabout, No. 104 in the contest for the Chicago trophy, met a hearse this morning while leaving Cincinnati and observed that it was a hoodoo and betokened bad luck, and so it proved. Later in the day when within 8

careless driving. Some member of the tour driving one of the cars struck a buggy and a woman was thrown out and sustained a fractured skull which later resulted in her death. She was driving at the time of the accident to get a doctor for her husband who was dying, and who since has died. The accident happened seven miles the other side of Frankfort, on the famous Georgetown Pike. The identity of the driver of the car is unknown. He drove away immediately after the accident and there were no witnesses to take the number of the car. The driver and other occupants of the car alone know who caused the woman's death. The management of the tour disclaims responsibility, but the natives generally blame the Gliddenites.

The worst roads encountered in the day's run were in Cincinnati, where holes in the

PREMIER NO. 2 ON A STRETCH OF REAL ROAD

THE CARTERCAR ENTRY WHERE THE GOING WAS GOOD

wont to make summer trips and are with the tour to demonstrate to the government how quickly a car with a light gun could be sent in pursuit of an army balloon and perhaps destroy it. The cadets sleep in tents and live on army rations while on this tour of duty. They guard the cars nights in regulation sentry duty, and generally are taking their pleasure picturesquely and rather seriously.

The running time for tomorrow's run will be nine hours 42 minutes.

Second Day—Vile Roads and Much Woe Enroute to Tennessee

Nashville, Tenn., June 15.—There was the loudest howl from the Gliddenites this evening that has been heard since the run from Toledo to South Bend in 1907, in which T. J. Clark was killed and several others injured. It was complained then that the day's schedule was too stiff for the muddy going following an all night rain, and tonight's protest is that the schedule of 20 miles an hour for touring cars and 18 for runabouts was too swift for the nature of the roads.

It is the consensus of opinion that the roads encountered today were the worst ever encountered in any former tour, barring none. Old Gliddenites say they never have seen such soul-trying roads for motor cars as they were forced to travel over at an average speed of 18 and 20 miles an hour. For about 90 miles the cars were forced to go over decayed pike serrated every foot of the way with sharp rocks. It was as if a telford base laid years ago was exposed, every inch of top dressing and filling being scraped from between the crevices. For about 30 miles more the going was slow by reason of water bars and sloughs, so that there were only about 70 miles of good and fairly good roads in which to make up the schedule.

The havoc on tires was appalling. Even the pacemaker's car exhausted all of its inner tubes in a series of 100 punctures and blowouts and had to borrow from other cars to get in. Cars were stuck in the mud and had to be hauled out by others, and while the majority arrived here tonight without penalization it is recognized that it was at the expense of a fearful strain which will tell upon them later on in the tour.

The effects of the day's run were reflected

in the day's score of penalizations which are as follows:

No. 3 Chalmers, 20 points for ignition troubles and new spark plug; No. 4 Chalmers, 6 points for adjusting carburetter; No. 6 Cole, 75 points for clogged gas pipe and new steering knuckle; No. 9 Parry, 3 points for new spark plug; No. 11 Ohio, 100 points for soldering leaky radiator; No.

12 Ohio, 104 points for replacing a valve; No. 14 Pennsylvania, 94 points for engine and steering troubles; No. 15 Cino, 20 points for ignition trouble; No. 105 Parry, 6 points for leaking radiator.

No. 104 Cole and No. 109 Cartercar had not checked up to 10 o'clock tonight.

These penalizations leave but six clean scores in the Glidden contest and eight in the Chicago contest.

Tire troubles played such hob with the official car that Chairman Butler was obliged to transfer his flag to the Premier, driven by McNamara. The military cadets in the two "balloon destroyers" also had their troubles and had a whole day's drill in removing and replacing tires; they used up all their spares and had to borrow tires to reach the night control. Two other of the non-contestants fell on evil times. The acetylene tank on the Reo exploded and the car did not reach here until 10 o'clock tonight, while the Rapid truck ran into a sinkhole and had to be pulled out. Matson's Chalmers ran into the same hole and was "rescued" by the Cutting press car.

The route today followed the historic Bardstown pike from Louisville. The first part, as far as Ferncreek, 11 miles out, was good and the drivers hit it up at 30 and 35 miles an hour to gain time for the bad going to follow. Early in the succeeding stretch they became acquainted with the peculiarity of southern roads in the absence of culverts. Somebody ought to send road commissioners south of Mason and Dixie line a picture of a culvert so they might gain an idea of what it is like. Streams and creeks flow across the highways, and there was nothing for the motor cars to do but play submarine and dive in.

STANDING AT END OF SECOND DAY.

\* Disqualified; lost 1,042 points for time and labor replacing new wheel broken in collision.

‡ Not reported.

In some instances the water was as high as the running board. There were many of these streams encountered in the day's run, and every time the cars had to wade through.

At Thixton the cars encountered the first of the rocky pike. The people patronizing the highway wouldn't stand for toll gates and abolished them. In this way they also abolished whatever work was done for the maintenance of the pike and for miles and miles it was worn down to the original rock paving. There was a stretch of good road from Saltriver to Bardstown and there was another from Athertonville, with the school house which Abe Lincoln

in progress and the factionists were waving the bloody shirt at one another, and calling upon the old confederates and sons of confederates to stand by the Democracy.

#### Reveals Glidden Route Hazards.

So that all who follow the fortunes of the Glidden tour, whether from the tonneau or the clubhouse chair, may be well posted on the hazards to be taken, the Mitchell-Lewis Motor Co., Racine, Wis., has issued a sort of unofficial guide book. It is reminiscent of the impulsive tour of the Mitchell Ranger early in the spring when it not only covered nearly 3,000 miles on the roughly indicated route of the tour,

150 marks (\$35) or with imprisonment. The slow speed and other restrictions are demanded by the extremely dangerous mountain roads of that district, where deep ravines and precipices abound. On the level roads of Bavaria a speed of thirty kilometers (18 miles) is permitted.

#### Use of Motor Cars Nullifies Election.

Motor cars have become such an established feature of American politics as to make surprising the decision of an English court that the election of Frederick Edward Guest to the House of Commons is void because automobiles were used in "getting out the vote." The special election court declared against him on the ground that the candidate's expenses were excessive and that a full return concerning them had not been made by his agents, it being shown that Henry Phipps, the steel manufacturer of Pittsburgh, who is Guest's father-in-law, had hired a number of motor vehicles on his behalf on election day. The hiring of vehicles for getting out the vote is not permissible under the British laws.

#### Motor 'Bus Line Over Mont Cenis Pass.

In connection with the reported opening of the Mont Cenis pass over the Alps to automobiles, it is now announced that an automobile 'bus service is to be inaugurated shortly between St. Michel and Susa over this pass. Members of the European touring clubs, while elated over the opening of the pass to touring cars, are somewhat nettled over the fact that a permission to use the pass should have been withheld from them until a commercial enterprise entered the field and obtained a concession from the Italian and French authorities.

#### Turning a Theft to Advantage.

In discovering a means to turn an unhappy event into advertising capital, a rather high mark has been established in Indianapolis. Following the theft of a motor car belonging to an Overland official, the local newspapers contained a column advertisement in sensational type, reading as follows: "Wanted—To meet the man who stole Will H. Brown's automobile from in front of the Columbia Club Tuesday noon. Liberal reward paid for information as to why he selected an Overland from the great array of other makes."

#### Traveling Bookshops in Great Britain.

Traveling bookshops are a new development in the literary trade. Automobiles stocked with the new productions are scouring the country districts of England, where bookshops are few and far between. The cars, which are specially constructed for rapid conversion into shops, cost about \$3,000 each. Besides the indispensable chauffeur, a salesman and porter are traveling with each car. At present there are three of these cars in operation traveling from London west, northwest and northeast.

MAP SHOWING THE ROUTE OF THE GLIDDEN TOUR

attended, according to tradition, and which was pointed out in its present capacity of a hen house. The Green River, near Bowling Green, was approached by a splendid smooth highway and beyond, to Franklin, it ran smoothly. But over the mountains to Goodlettsville stone corduroy occurred again.

It was a continuous ovation and a carnival of flowers all the way from Louisville to the Kentucky boundary line where a fat colored woman sat upon the stone that separated the states, just beyond Franklin. The Kentucky girls, pronounced the handsomest ever seen, pelted the occupants of the cars with flowers. The bouquets generally contained the address of the sender. The colored people were out in hordes, but gazed at the parade meekly. Those white men had no waves of the hand for them! Twice the confederate flag appeared. At Magnolia a small boy ran out and waved the emblem of the lost cause. At Franklin, when the Gliddenites reached the Maxwell House, a political caucus was

but did some pathfinding for the real pathfinder which followed it sometime later. "Way down South in Dixie," the booklet is called, and besides giving the full itinerary of the Ranger's trip, it has a running story of the rather adventurous journey, plentifully embellished with pictures.

#### Road Rules at Oberammergau.

In connection with the opening of Oberammergau to motor vehicles, attention is called to the strict rules of the road in force, which expressly forbid any automobile to overtake and pass any other automobile going in the same direction, excepting in the event that the latter breaks down or is compelled to stop. Horse-drawn vehicles traveling in the same direction may be passed only when the road is absolutely free from vehicles traveling in the opposite direction. Under no circumstances may any automobile or other vehicle travel at a greater speed than fifteen kilometers an hour (9 miles). Violators of any of these rules will be punished by a fine of

## FOUR HARD DAYS FOR RICHMONDS

**Endurance Run to Raleigh and Return Leaves but One Perfect Score—Officials in an Accident.**

Mechanical troubles and bad roads were the chief conspirators against perfect scores in the Richmond (Va.) Times-Dispatch's four days' endurance run to Raleigh, N. C., June 7 to 10, but despite this handicap at least one of the 14 starters survived the four days' struggle with roads and weather without penalization. The lucky one was L. M. Foster, Buick, who came through without any hieroglyphics on his score sheets, and by his performance was a double winner, capturing the Sweepstakes cup in addition to his class trophy.

Twelve contestants survived the test, although all but Foster were assessed for various causes, some of the penalizations being exceedingly heavy. The other class winners were Edgar Hicks, Maxwell; E. C. Pelouze, Chalmers, and Howard Wagner, Speedwell, the latter having the second best score among those who finished. Not satisfied, however, he entered a protest against the penalties inflicted, but it was not sustained. The starters were the following: Rufus Williams, Buick; Howard Wagner, Speedwell; B. D. Daniels, Hupmobile; J. R. Williams, Buick; Dr. Samuel McAnally, Maxwell; J. J. Tignor, Overland; J. T. Palmatory, Chalmers; E. C. Pelouze, Chalmers; E. J. Allen, Rambler; S. Stagg, Regal; T. E. Williams, Buick, and Edgar Hicks, Maxwell.

The two delinquents who failed to finish were D. McAnally, Maxwell, and S. Stagg, Regal. McAnally struck a plank on a dilapidated bridge near Petersburg and ripped a hole in his crankcase, while Stagg bent an axle and got water in his gasoline from the heavy rain on the last day. The total distance was 300 miles, the daily stages being as follows: First day, Richmond to

Littleton, 107 miles; second day, Littleton to Raleigh, 83 miles; third day, Raleigh to Clarksville, 90 miles; final day, Clarksville to Richmond, 110 miles.

Owing to the heavy roads, mechanical troubles were numerous, and only two cars went through the technical test without penalization. These were the ones driven by Foster and Wagner, but the latter already had incurred road penalties, so the winner had clear sailing to the trophies. The penalizations were heaviest on the last day's run, which was the longest and was over execrable Virginia roads.

The contest was marked by one serious accident, which occurred on Tuesday, the first day, and came near to having a fatal termination. Singularly enough, it was the officials who were concerned instead of a contestant as usually is the case. When a few miles from Littleton the night control, Coleman Cutchings, who was driving the White official car, had a fainting spell, the wheel slipped from his nerveless fingers and the car dashed over a 35-foot embankment onto the tracks of the Seaboard Air Line which run close by the scene of the accident. All of the occupants were thrown out by the terrific impact when the car struck. Aid soon arrived from cars which were following close behind, and the occupants of which witnessed the disaster. Cutchings was found with his head completely buried in the mud alongside the embankment. R. B. Tellport, observer, and W. B. Nelson, checker, were found unconscious and bleeding from wounds about the head, while Allen Potts, managing editor of the "Times-Dispatch" was found half conscious, suffering intensely. The injured men were placed on stretchers and taken to Littleton to a hotel where physicians attended to their hurts. Potts and Cutchings were able to continue with the run, but the other two sustained serious though not dangerous injuries which will incapacitate them for a time before they fully will recover.

The results are given in the following table:

Division 1.						
	1st Day	2d Day	3d Day	4th Day	Technical	Total
Edgar Hicks, Maxwell.....	0	0	0	77	46	123
B. D. Daniels, Hupmobile.....	0	6	85	142	10	243

\* Disqualified; did not finish; did not take technical examination.

## ELECTION AFFECTS SAVANNAH RUN

**Jacksonville Club's Contest Suffers from Heat of Politics—Trip Proves Easy and Uneventful.**

That election day is not an auspicious date on which to hold an endurance contest if a large field of starters is desired, was convincingly impressed on the officers of the Jacksonville (Fla.) Automobile Club on Tuesday, 7th inst., the occasion of the club's first endurance run to Savannah, Ga., to attend the good roads convention. Instead of the expected two score and more starters which advance prognostications had indicated would be on hand, only a lean dozen cars came to the scratch when the starting hour arrived. With one of the hottest political campaigns in the history of the state reaching its zenith, the large large defection strikingly illustrated that the average Southern motorist prefers the excitement incident to the battle of the ballots to the doubtful thrills of an endurance contest. Even the expensive \$300 trophy offered by the club and the "Times-Union" and Savannah A. C. cups did not serve to attract a big field.

Each car bearing fluttering pennants with the word "Jacksonville" thereon, and witnessed by hundreds of spectators, the start was made at 8 o'clock, Tuesday morning, 7th inst., from the city hall, the contestants being the following: Dr. W. M. Stinson, Oldsmobile; L. C. Oliver, Ford; W. E. Sloan, Overland; Herbert B. Race, Ford; Hobart C. Hare, Buick; O. S. Albritton, Cadillac; P. A. Holt, Cadillac; Forrest J. Hyde, Jr., Cadillac; George F. Bessel, Cadillac; M. D. Johnson, Oldsmobile; D. H. McMillan, Oldsmobile, and B. A. Coleman, Hudson.

All of the cars reached Brunswick, Ga., early in the afternoon and the party put up there for the night. The excellent roads encountered made the run akin to a pleasure jaunt, and beyond a few tire troubles no mishaps occurred. The second and final day's run of the 176 miles trip was equally uneventful, and 11 cars finished with perfect road scores. The unfortunate was W. E. Sloan, Overland, who experienced trouble near Savannah and arrived late. The tourists were escorted into the city by a delegation of motorists from the local club.

### Springfield Club Elects Officers.

Springfield (O.) Automobile Club—President, Frank R. Packham; vice-president, C. W. Arbogast; secretary-treasurer, George Mentel. Committees also were appointed: Membership, R. A. Worthington and Charles Winkler; Runs and Tours, George Limbocker and Foster B. Houston.

### ALL OLDFIELD AT KANSAS CITY

**"The Greatest Ever" has Easy Pickings at Postponed Meet—Thurman Takes All that he Left—A Handicap.**

After no less than four postponements on account of the rain that has deluged almost the entire country for the past two or three weeks, Barney Oldfield and his racing stable, reinforced by several local drivers and cars, were able to carry out a part of their program at the Elm Ridge mile track near Kansas City, Mo., on Saturday last, 11th inst. A two days' meet originally had been scheduled for June 3 and 4, but the constant wet weather made several postponements necessary. A clear day finally broke on Saturday, but the soft track prevented any remarkable performances, though it did not prevent Oldfield from having the usual spotlight turned full in his direction. Because of a feeling against Sunday racing the program was compressed into one day, and 5,000 persons saw Oldfield do his usual stunts.

Both Kerscher and Oldfield tried for mile records in their racing mastadons, but neither was successful in shattering previous "dirt track records," although the times were not by any means slow. Oldfield made three attempts, his first trial—52½ seconds—being the fastest.

The feature event of the afternoon was a 50 miles stock chassis race in which Oldfield entered with his fast Knox car. Strang was up in a Jackson, LaRoche and Clarke piloted Cuttings, Miller handled a Warren-Detroit, and Thurman started in an Auburn. Oldfield soon assumed the lead and had no trouble in lapping the other contestants about as he pleased. In the first four miles Strang and Thurman had a pretty duel. Up to the 28th mile Oldfield had lapped every other car except the Auburn, which then was compelled to withdraw with a leaky radiator. It resumed the running after two laps, but could not make up the lost ground. Strang also lost a lap through tire trouble. Oldfield finished in 56:07 and LaRoche and Clarke followed, respectively, in 59:04 and 1:00:04.

In the 5 miles free-for-all stock chassis Oldfield and Strang gave the crowd its money's worth by running neck and neck until the last few yards, when Oldfield unloosed another notch and won out by a length. The free-for-all handicap was won by Thurman, in an Auburn, who had no trouble in keeping considerable distance ahead of the remainder of the field. The real fun was in the fight for second place, Clarke defeating Miller with nothing to spare. Two motorcycle races completed the program. The summary:

Five miles for motorcycles, 30½ cubic

inches—Won by Norton, Merkel; second, Saufley, Excelsior. Time, 6:44.

One mile motorcycle exhibition—By Norton, Merkel. Time, 1:09.

One mile against time—By Kerscher, Darracq. Time, 0:53¾.

One mile against time—By Oldfield, Benz. Time, 0:52½.

Five miles free-for-all stock chassis—Won by Oldfield, Knox; second, Strang, Jackson; third, Miller, Warren-Detroit. Time, 6:02½.

Five miles handicap, free-for-all—Won by Thurman, Auburn (1:10); second, Clarke,

### DE PALMA TOPS GIANT'S DESPAIR

**Makes Record-Breaking Flight up Wilkes-Barre's Mountain—Belcher Leads Two Classes—Honors Well Distributed.**

Undismayed by the rain, which caused a postponement of the fifth annual national hill climb on Giant's Despair from Saturday last, 11th inst., the Wilkes-Barre (Pa.) Automobile Club managed to hold the event on Tuesday, June 14th, and the affair did not lose a great deal by the postponement. It

GENERAL VIEW AT FIRST "S" TURN ABOVE DEVIL'S ELBOW

Cutting; third, Miller, Warren-Detroit. Time, 5:48¾.

Five miles motorcycle handicap, 61 cubic inches—Won by Lindle, Merkel; second, Norton, Merkel. Time, 5:55.

Fifty miles free-for-all stock chassis—Won by Oldfield, Knox; second, LaRoche, Cutting; third, Clarke, Cutting. Time, 56:07.

#### Horse, Motor Car and Aeroplane to Meet.

A race between the speed marvels of the past, present and future, viz., the horse, automobile and aeroplane, is the rare offering with which the promoters of the Twin City aviation-automobile meet, to be held at the state fair grounds, St. Paul, Minn., June 22-25, have arranged to thrill the spectators. Minor Heir, a fast harness stepper, will uphold the prestige of the equine on a half mile dirt track, while Barney Oldfield will drive a Benz car on the outside mile oval and Glenn Curtiss in a biplane will endeavor to outdistance his earthly rivals. Each contestant will make two circuits of the course, the horse traveling only half as far as the others; Curtiss, of course, will endeavor to follow an approximate course above.

was eminently successful and was witnessed by an immense crowd, which, however, scarcely was as large as the crowd which saw the event in previous years when it was held on a holiday. The spectators as usual were treated to some dare-devil driving, and saw Ralph DePalma lower the record for the course.

In the free-for-all climb DePalma was at the wheel of his famous Fiat, and when he thundered up the long winding mountain road the spectators that fringed both sides of the road gave him a wide berth. With a noise like a big gatling gun, this intrepid Italian shot up the slight rise to the dangerous Devil's Elbow, hurtled around the crook like a frightened hornet and plunged upward and around the famous double "S" curve to the Mountain House turn, seemingly gathering speed with every explosion of the giant motor, until he darted across the finish line at Prospect Rock, like Hamilton making one of his famous dips. The crowd yelled its approval of the magnificent performance, for intuitively they realized a record had been shattered, and they had but a moment to wait for verification. The megaphone men simultaneously gave out the news:

"DePalma's time was 1 minute 28 $\frac{3}{4}$  seconds!"

Then the crowd cheered and gave DePalma an ovation when he passed the Mountain House on the way back to the starting point, with the blue flag of victory in his hand. DePalma earned the plaudits, for he had traveled up Giant's Despair mountain faster than any man ever had traveled it before. The record for the course stood at 1:31 $\frac{3}{4}$ , made last year by David Bruce-Brown, in the 120 horsepower Benz; on that occasion DePalma finished second. The same Benz car, with E. A. Hearne as pilot, started in the event Tuesday, and after a false start began again, but stopped half way up the incline. Zengle, in the big Chadwick, was a not dangerous

fortunately, was without serious results. Tom Berger's Warren-Detroit car overturned at the Mountain House turn. Berger was thrown out, but escaped injury, although the car was not so fortunate.

The first driver to cover the course in less than two minutes was Ray Harroun, the well known Marmon crack, who won the 231-300 cubic inches class in the record time of 1:50 $\frac{3}{4}$ , Robert Johnston running second in his Pope-Hartford in 2:05. The succeeding three events resulted in a clean-up for Knox cars, Belcher winning the 301-450 class and the Hollenbeck Trophy event, while L. A. Disbrow took the honors in the 451-600 class. Honors in all these events were closely won and the interest therein consequently keen.

Stock Chassis, 451-600 Cubic Inches.

- 1 L. A. Disbrow, Knox.....1:47 $\frac{3}{4}$
- 2 John Aitken, National.....1:55
- 3 William Tousey, National.....1:58 $\frac{1}{2}$

Fully Equipped Stock Cars, \$2,000-\$3,000, for Hollenbeck Trophy.

- 4 Thomas Kincaid, National.....1:53 $\frac{1}{4}$

DISBROW (KNOX) MAKING A GOOD GETAWAY

HOLT (POPE-HARTFORD) DRIVING HIS OWN CAR

second, his time being nearly 10 seconds slower than DePalma's.

The Giant's Despair mountain is, perhaps, the most famous automobile hill climbing course in America, and any car must be a good climber to reach the top. The length of the course, from start to finish, is exactly 6,000 feet, and at the steepest point the gradient attains a slope of 22 per cent. In addition to its steepness there are innumerable twists and turns, and at one point a slight deviation from the course means falling 100 feet to a quarry below. The driver has ample use for all his nerve and skill.

Although he made a magnificent run and broke the record for the course, DePalma was not the only hero of the occasion. Several prominent drivers and cars were on hand, and there was not a walkover in any event. Faster times than last year prevailed in all the events, and a great deal of the success of the meeting was due to the excellent policing by the Pennsylvania State Constabulary—that excellent body of police whose command is heeded as readily as the upraised hand of the London "bobby."

The only accident of the day occurred in the first event, for stock chassis within the 161-230 cubic inches category, but this, for-

John Turner came in for a large share of applause when he won the class for cars owned by members of the Wilkes-Barre A. C., and costing over \$2,000. Turner's Matheson covered the course in 1:46 $\frac{3}{4}$ , and he had the distinction of defeating such well known cracks as Belcher, Aitken and Johnston.

In addition to the free-for-all which DePalma won, there was a consolation free-for-all, from which DePalma was barred. Len Zengle, who ran second in the first event, had no trouble in winning the consolation, his time, 1:37 $\frac{3}{4}$ , being three-fifths second slower than in the free-for-all. The summary:

Stock Chassis, 161-230 Cubic Inches.

- 1 H. A. Bauer, Oakland.....2:17 $\frac{3}{4}$
- 2 Frank Martz, Reo.....2:21 $\frac{1}{2}$

Amateurs Can't Have Hotel Bills Paid.

Because, it is alleged, of the activities of Caleb Bragg, the contest board of the A. A. has ruled that any driver who accepts payment of his traveling, hotel or other expenses violates the amateur rule which forbids the acceptance of cash or other valuable consideration. Payment of such expenses is interpreted as being a "valuable consideration." Bragg, who generally is touted as the "millionaire amateur driver," had desk room in the office of the importers of the car with which he competes, but apparently the A. A. A. contest board does not consider the fact to be evidence that he is "actually engaged in the automobile or accessory industries," which activity, according to the rules, is sufficient cause for denying amateur registration.

**GAYNOR GREETS GOOD ROADSTERS**

**New York's Mayor Says Nice Things to Atlanta-New York Tourists—Few Finish with Clean Scores.**

Apparently forgetting the temporary animosity which he displayed towards motorists a few days ago when he told a party of them who attended a hearing in his office to protest against the closing of a portion

he had concluded Colonel Gray of the Atlanta Journal responded and presented the mayor with a silver loving cup, the gift of Mayor Maddox of Atlanta.

This ended the festivities on the island and the tourists, who included several family parties, embarked for New York, landing at the Battery and proceeding up Broadway past the City Hall—where the mayor again reviewed them—to Herald square, where they were dismissed.

Immense crowds, such as only New York

the run with perfect scores. The honor division were the following: Class 2—E. M. Willingham, Atlanta, Ga., Ford; Class 3—D. K. McColl, Bennettsville, S. C., Cadillac; James A. Gray, Jr., Winston-Salem, N. C., Mitchell. Class 5—Norman Gallatin, York, Pa., Pullman. Class 6—E. H. Inman, Atlanta, Ga., Pope-Hartford. Class 7—E. M. Durant, Atlanta, Ga., Pope-Toledo; Asa C. Candler, Jr., Atlanta, Ga., Lozier.

Sixty-two contesting cars started from Atlanta, Ga., on Monday morning, 6th inst., on the second annual Good Roads tour to New York over the proposed national highway between the two cities, and 48 of them arrived at their destination despite unusual hardships in the shape of bad roads and unfavorable weather. The total distance was about 1,100 miles, and the tour occupied 8 days. The night controls were as follows: Monday, 6th, Anderson, S. C.; Tuesday, 7th, Charlotte, N. C.; Wednesday, 8th, Martinsville, Va.; Thursday, 9th, Staunton, Va.; Friday, 10th, Gettysburg, Va.; Saturday, 11th, Philadelphia, Pa., where the tourists spent Sunday; Monday, 13th, finished at New York.

The 48 survivors were as follows: Asa C. Candler, Jr., Atlanta, Ga., Lozier; Colonel John J. Woodside, Atlanta, Ga., Thomas; W. J. Stoddard, Atlanta, Ga., National; Robert E. O'Donnelly, Atlanta, Ga., Packard; Edward M. Durant, Atlanta, Ga., Pope-Toledo; Regal Motor Car Co., Atlanta branch, Regal; Jackson P. Dick, Atlanta, Ga., American Traveler; Edward H. In-

ATLANTA-NEW YORK TOURISTS ARRIVING AT HERALD SQUARE

of the Coney Island boulevard to motorists, that they were a selfish lot, Mayor Gaynor of New York went down to Staten Island in the harbor on Monday afternoon, 13th inst., to welcome the tourists in the New York Herald-Atlanta Journal Good Roads tour to the metropolis. When the mayor arrived at the Staten Island automobile club house, where he found a majority of the tourists awaiting him, he welcomed them to the city and told them how glad he was to greet them. Immediately after the official "Howdy" had been pronounced the visitors repaired to Hugot's Crystal Gardens for luncheon.

When the mayor entered the dining hall the entire assembly arose and launched a political boom for him by greeting him amid cheers as the next president of the United States. One enthusiastic Southerner even promised him the Georgia vote. Then his honor commenced in his best formal manner with that stock phrase which is so often used that it deserves to be classed as a commodity that he was glad to welcome them and to meet them. Those Southerners with whom he already had come in contact in the city had impressed him as being a pretty good sort all through. Of course he did not forget to commend the enterprise and public spirit of the newspapers which engineered the tour, and after

THE "OPEN AIR GARAGE" AT GETTYSBURG

can furnish on short notice, greeted the tourists as they rolled up Broadway in their mud-stained and pennant-bedecked machines on the last stretch of their 1,100 miles struggles with execrable roads and weather most of the way.

While the official results have not been announced yet, it is stated on good authority that 7 of the 48 surviving cars finished

man, Atlanta, Ga., Pope-Hartford; C. W. DuPree, Marietta, Ga., Maxwell; Charles I. Ryan, Atlanta, Ga., Columbia; W. E. Wimpy, Atlanta, Ga., Buick; J. H. Marsteller, Roanoke, Va., Chalmers; E. M. Peacock, Cochran, Ga., Cadillac; Mrs. Myrtle L. Barnes, Montgomery, Ala., Stevens-Duryea; Charles T. Smith,

## RULES THAT PROMOTE CHEATING

**So Says Flanders of A. A. A. Stock Car Regulations — Remarkable "Options" Discovered by His Investigators.**

Convinced that in operation the A. A. A. stock car rule is largely a joke, the E-M-F Co. this week announced that it had abandoned its previously expressed intention to enter the racing field. Its decision grew out of the visit made to the last racemeet on the Indianapolis Speedway, by James Heaslet, the E-M-F chief engineer, and a corps of technical experts, Heaslet, incidentally, being a member of the rules com-

E-M-F company be glad to enter the lists and pit its stock models against all comers," says President Flanders, of the E-M-F company, in referring to Heaslet's discoveries. "But so long as conditions are as they are it resolves itself simply into a case of who can cheat the most, and who is cleverest at finding loop-holes in the rules or enlisting influence of racing management to evade such rules as confine contestants to fair method; so long will we stay out of these events."

### Bigelow Falls Short of the Record.

C. H. Bigelow, who in a Mercer car left New York on May 16th, intent on breaking the cross-continent record of 362 hours, failed of his purpose. He reached his des-

TWO FAMILY GROUPS OF GOOD ROADS TOURISTS—EDWARD M. DURANT (POPE-TOLEDO) AND JOSEPH F. GATIN (KNOX)

Concord, Ga., Maxwell; N. W. Wallace, Jr., Charlotte, N. C., Hupmobile; Georgia Brush Auto Co., Atlanta, Ga., Brush; Preston S. Arkwright, Atlanta, Ga., Pope-Hartford; John W. Grant, Atlanta, Ga., Locomobile; E. D. Crane & Co., Atlanta, Ga., Hupmobile; John Moore & Co., New York, Brush; J. Epps Brown, Atlanta, Ga., Selden; Dr. E. C. Seawright, Fayetteville, Ga., Ford; Ohio Motor Car Co., Cincinnati, O., Ohio; Carter and Logan Bros., Savannah, Ga., Cole; A. P. Herrington, Atlanta, Ga., Reo; R. D. Apperson, Lynchburg, Va., Palmer-Singer; R. G. Scruggs, Waycross, Ga., E-M-F; Emmett Callan, Washington, Ga., Maxwell; J. W. Mangham, Griffin, Ga., Columbia.

The 14 starters who failed to finish were the following: Beaumont Davison, Atlanta, Ga., Packard; Joseph F. Gatins, Jr., Atlanta, Ga., Knox; W. S. McNeal, Jr., Atlanta, Ga., Lambert; J. T. McNinch, Atlanta, Ga., Lambert; White Star Co., Atlanta, Ga., White Star; Maxwell-Briscoe Motor Co., New York, Maxwell; Kelley-Knight Motor Car Co., Atlanta, Ga., Kisselkar; C. D. Smith, Albany, Ga., Jackson; Julian H. Reynolds, Augusta, Ga., Maxwell; L. C. Brown, Athens, Ga., Mitchell; W. G. Humphrey, Atlanta, Ga., Pullman; Robert Campbell, Cedartown, Ga., Oakland; M. L. Thrower, Atlanta, Ga., Ohio; Lamar S. Collier, Atlanta, Ga., Buick.

mittee of the A. A. A. Their investigations quickly uncovered the startling effects of the rule which permits a car to be subjected to a great variety of mechanical "options" or alterations and yet to remain a stock car.

Mr. Heaslet and his associates found "stock cars" which, to quote E-M-F language, were "simply idealizations of regular models, prepared for racing, in many cases, by months of expert labor." The beautiful workings of the "option" clause in the rules resulted in such departures from "identical specifications and designs" as the following: Special ignition equipment; reduction in the number of piston rings; enlarged lubrication leads, specially constructed camshafts; specially timed valves; systematic lightening until some of the cars varied only a pound or two from the racing minimum of the class; racing rims and tire equipment; radical revision of the system of control and scores of other variations. Mr. Heaslet found also that the rule forbidding the use of adulterated gasoline was wholly forgotten.

"When the rules are such as to eliminate from 'stock car' events all such cars as do not actually represent standard construction—in short the car sold to customers, and when those rules are enforced in the spirit as well as in the letter without favoritism or technical evasion, then will the

tinuation, Los Angeles, on Monday night last, 13th inst., having occupied 28 days, which, nevertheless, was good going. He followed an unusual route, via St. Louis and the old Santa Fe trail, and encountered much hard traveling and suffered many hardships, particularly in crossing the deserts.

### Gives Trophies With Some Cars.

Certain sentimental considerations attach to cars that have won prominent competitive events, inducing purchasers to select those particular machines rather than others of the same pattern. In recognition of the existence of such associations, C. W. Matheson, president of the Matheson Automobile Co., New York, in recent instances has included the trophies that the car won, in making the sale of such machine, giving the purchaser the tangible proofs to support boasts as to what the car has done.

### Bridgeport Climb an All Around Failure.

As the sparsity of contestants would imply, it now develops that the Bridgeport (Conn.) Automobile Dealers' Association's unsanctioned and much opposed hill climb on Decoration Day, not only was a sporting farce but also a financial failure. While all accounts are not yet liquidated, reports indicate that the deficit will amount to about \$200.

**BIG PROGRAM FOR INDIANAPOLIS**

**Motor Speedway Events Scheduled for July 1, 2 and 4—Cobe Trophy Race to be Only 200 Miles Long.**

Entry blanks for the contests for the Cobe, G & J and Remy trophies which will form the nucleus of the second Grand Circuit meeting of the season on the Indianapolis (Ind.) Motor Speedway on July 1, 2 and 4, were issued this week. Interest naturally centers in the Cobe race which under the direction of the Chicago Automobile Club will be staged for the second time on July 4, the final day of the meet-in, and this year will be run under changed conditions, in that it will be contested on a speedway; last year it was a road event, 395 miles, and was run on a 23 miles circuit at Crown Point, Ind.

Contestants in the 1910 race will not travel as far as did the competitors last year, the distance having been reduced to 200 miles. These changes in the race conditions, which are permissible under the deed of gift, are said to be so unsatisfactory to the Buick Motor Co., title holder of the trophy, that it has decided not to defend the cup.

As was the case last year, the second Cobe race will be a stock car event and will be open to cars with a piston displacement not exceeding 600 cubic inches, and a minimum weight of 2,300 pounds. In addition to possession of the trophy until it again is raced for, the winner will receive \$500 in gold, while the second place will be worth \$300 and third will net the holder \$200.

In addition to the Cobe race, the remainder of the Independence Day bill will consist of two 5 miles events for stock chassis under 160 cubic inches, and between 231-300 cubic inches respectively, and a trio of 10 miles races for cars eligible in the 161-230, 301-450 and 451-600 classes; also there will be a 10 miles free-for-all and a 20 miles handicap open to all comers.

On Friday, 1st inst., the opening day of the meet, the premier number will be the race for the G & J trophy, valued at \$1,000. The distance will be 50 miles, and cars in the 231-300 division, weighing less than 1,700 pounds, will be permitted to battle for it. The cash prizes in this race are \$150, \$100 and \$50 respectively. Robert Burman, who captured the Speedway silver helmet last month, and which carries with its possession \$50 per week, will be called on to defend it on this day. The distance will be 10 miles and is an open event. The rest of the day's card consists of the class events and a 10 miles handicap.

Valued at \$2,500, the Remy Grand Brassard and Grand trophy which Ray Harroun in a Marmon captured at the May meeting again will be raced for on Saturday, 2nd,

and will be the feature event. Possession of the Brassard carries with it \$50 per week, which is increased to \$75 if the winning car is equipped with a Remy magneto. The trophy is held by the maker of the victorious car. The distance is 100 miles, and in the coming race the engine limitations have been raised from 231-300 cubic inches displacement, to admit all cars under 450 cubic inches.

**Locomotive is Grant's Mascot.**

Gobbos, gumbos, eagles, bull dogs and other forms of mascots have adorned radiator caps for some time but the most unique form of motor-millinery, or bonnet decoration, as one pleases, appears on Harry Grant's Alco touring car. It has an in-

GRANT'S ALCO CAR WITH LOCOMOTIVE MASCOT

teresting miniature locomotive and tender hauling a miniature Vanderbilt cup, set on the hood of the demonstrating car which he drives around Boston. Of course, it was designed to call attention to his and the Alco's victory in the last Vanderbilt cup race, and so well did it serve the purpose that ever time Grant stopped a crowd collected. In fact, he almost was arrested for obstructing the traffic but escaped incarceration by moving on before the five minutes for stops allowed by law had elapsed.

**Takes Long Journey Toward Home.**

While the practice of purchasers driving their cars from the factories to their homes is a common one, George H. Harter, of Sacramento, Cal., probably is establishing something of a record in that respect. He has purchased a friction-driven Cartecar at the factory at Pontiac, Mich., and is driving it to Chicago, from which place he will go south into Texas, thence across to Los Angeles and up to Sacramento, his home town.

**RUN OLDSMOBILE RACES IN A HAT**

**Owners Gather at Empire Track for Third Annual Reunion—Weather Compelled Lottery for the Prizes.**

One hundred and sixty-nine Oldsmobile owners, under the leadership of Gen. John T. Cutting, braved the inclement weather on Saturday last, 11th inst., and drove to the old Empire track to participate in the third annual reunion of their clan. Possibly their courage was bolstered up to a degree by the announced intention of the Olds-Oakland Co., the local Olds representatives, of raffling off a brand new car

of latest model to one of their number.

The original plans called for a more or less ambitious racing card, interspersed with aeroplane flights, and a picnic fest. But when the party assembled at the grass-grown trackside it was found that the effect of the rain had been to render the course unfit for speeds such as even the curved dash oldtimers were expected to show. Consequently the schedule was modified and so that everybody might be satisfied it was decided that all of the prizes offered should be drawn for. Therefore the "races" were run in a hat, with a merry maiden for time-keeper and scorer. A. C. Stem, a New York real estate man, drew the lucky number which decided the ownership of the new car. The decision of this momentous question was about the only part of the original program that went off according to schedule. Twelve of the little curved dash runabouts being on the spot, their owners raffled for the prize which had been offered them in competition. The same plan was followed by the entrants in each of the other events listed.

## HAD HORSES WAITING FOR THEM

Promoter Made Certain His Contestants Would Reach Montauk Somehow—Annual Visit to Long Island Hotels.

After previously having made a private expedition over the route to consummate the "usual arrangements" with his friends, the bonifaces, the Motor Contest Association which in private life is W. J. Morgan of New York, "delivered the goods" on Tuesday and Wednesday, 14th and 15th inst., when some 50 cars, of which 33 were contestants, unloaded guests at Morgan's "official hotels." This year's "Around Long Island reliability run" officially is styled "Montauk Light or Bust," and certainly is rightly named, for at least one car "busted" on the first day, if destruction by fire is in that category. On account of the hard roads which were included in the first day's run, the start was set for 6 a. m. from the Metropolitan tower at Madison avenue and 23d street.

Shelter Island, 211 miles by the official route, was the objective the first day, and enabled the motorists to liberally distribute their surplus wealth at the numerous hostleries on the way. Crossing the Queensboro bridge the course lay along the famous Merrick road to Southampton, the halfway point and a control station. Seventeen miles further on at Three Mile Harbor the association established the dinner stop, and awarded the contract for it to Ulysses Lee, whose terms undoubtedly were satisfactory to the promoter if not to the diners themselves. Passing through Amagansett, the "Busters" entered the sandy and rocky wastes of Montauk, known as the Bad Lands and rightly named. By advance arrangement teams were on hand here to pull out any cars which might become stranded in the sand and the foresight was justified, for over a dozen cars were mired in the mud, caused by the continuous recent rains, and required to be towed out. Some of the cars sank in the mire until their floors rested on the ground.

On arriving at the Montauk lighthouse the contestants who got that far were held in control to enable a majority of those behind to report, as part of the route doubled on itself here through the sand stretches and narrow lanes where it would be impossible for two cars to pass. After being released at the lighthouse the cars retraced their course over the sandy wastes to Southampton, and it was along this leg that three of the contesting machines got off the course and lost themselves. Scrub oaks dot the desolate wastes thickly, and although searching parties were sent out when the missing ones failed to arrive at the night control within a reasonable time, the searchers were unable to locate the

wanderers, who spent the night on the meadows. The labyrinth of blind roads in the vicinity easily would entrap and bewilder the most familiar with the locality. It also was in this section that one of the cars caught fire and was totally destroyed.

From Southampton the junketers traveled over to the south shore to Good Ground, and thence through Riverhead, Mattituck and Greenport to the night control at Shelter Island. All but the four cars previously accounted for arrived at the night control, where Chequit Inn was the official hostelry.

Leaving Greenport at 8:30 a. m. Wednesday morning, the course lay east to Orient Point, where a control was established to enable those who cared to to inspect the lighthouse. Continuing, the tourists followed the shore to Southold and there crossed the Long Island Derby course, another Morgan enterprise and a lamentable one from a financial standpoint, to Port Jefferson and on to Huntington, where the Motor Contest Association conducted his guests to the elite and aristocratic Cafe des Beaux Arts (it costs real money to dine here). Two hours were allotted for the stay here, in order that those who wished might top off their repast with a dip in the briny. Resuming the trip the route lay through Cold Spring, Oyster Bay and Sea Cliff, along the North Hempstead road to Flushing and thence home.

The contestants were as follows:

Division 1A, \$800 and under—Elmer D. Cutting, Hupmobile; R. E. Gillam, Hupmobile.

Division 2T, \$801-\$1,200—W. A. Starbuck, Ford; D. M. Hasbrouck, Mitchell; E. E. Easter, Buick; W. B. Young, Ford.

Division 3A, \$1,201-\$1,600—George Ainsley, Regal; William Simonson, Mitchell; E. M. Welch, Chalmers; E. A. Taylor, E-M-F.

Division 4A, \$1,601-\$2,000—Lewis Strang, Pierce-Racine; H. F. Earl, Auburn; O. R. DeLamater, Mitchell; John L. Gwyer, Elmore; Thomas Wilson, Westcott; Dr. William H. Nafis, Buick; W. Davenport, Buick; Philip Hines, Buick; Frank Remsen, Buick.

Division 5A, \$2,001-\$3,000—W. E. Shuttleworth, Haynes; Joseph Trehou, Mercer; C. J. Hickman, Franklin; George E. Mack, Selden.

Division 6A, \$3,001-\$4,000—Paul Harvey, Franklin; H. K. Sutherland, Knox; Ward Smith, Welch-Detroit; Arthur Coombs, C. G. V.

Division 7A, \$4,000 and over—V. P. Pisani, Zust; Walter Jones, Amplex; Peter Smith, Fiat; Earle A. Cryne, American; Edgar G. Murphy, Stearns.

### Automobile as a Paymaster.

Hereafter the outside city employees of Oakland, Cal., will be paid their wages at or near their place of work instead of leaving their employment and going down to the treasurer's office in the city hall to get their money. The police automobile takes the salaries for the week, amounting to about \$15,000, and is driven through the outlying districts, paying the scattered employees as it goes along. It is claimed that at least two hours working time for each man thus paid are saved to the city.

## MANY PRIZES FOR PREMIERITES

Premier Owners Again Gather at the Seashore and in Record-breaking Numbers—The Prize-Winners.

Owing to circumstances that the "Knickerbocker" division of Premier motorists, returning from their second annual outing at Cape May, arrived in New York City as an escort to the "good roads" and other things tourists all the way from Atlanta, some little confusion resulted. The combined forces reached City Hall on Monday afternoon, 13th inst., in imposing line, affording the impression that they had all come from the South, or that they had all come from Cape May, according to which brand of signs and banderoles happened to catch the eye. Actually, the Premier contingent numbered some 28 cars and represented the conclusion of one of the largest manufacturers' excursions, if not the largest, ever promoted.

The affair, which by virtue of "secret time schedule," consolation prizes for hard luck participants and other devices known to the kindly disposed organizer, had assumed a mild flavor of competition, centralized in Philadelphia. There delegations from Lancaster, Wilkes-Barre, Scranton, Newark and other eastern cities, joined with the local Premier owners and those who had come from New York, on the run to Cape May. The total number of persons on the four days' tour was more than 700, and despite the rains of the week-end and the muddy roads which resulted, no mishaps were reported. In part, this may have been due to the fact that the secret schedule feature usually results in the development of moderately slow pace. At all events, the only records broken were those for attendance and harmony.

The "guess" of Frank J. Lennon, of Mount Vernon, N. Y., was so good that it brought him the first prize, a chiming Westminster clock. George G. A. von Sholley, of Flushing, received a silver chafing dish in recognition of his, second best, effort at solving the speed riddle, while W. L. Manther, a Bay Port Premierite, received third prize, which was a combined tire case and lunch trunk. A brand new set of tires, a Jones speedometer, and a Mezger wind shield went to John D. Scott, Brooklyn; John Murphy, Mount Vernon; W. H. Ammermann, New York City, respectively. M. W. Coburn, Brooklyn, received the "hard luck" prize, a Thermos bottle outfit. The total value of the prizes was placed at \$3,000. The return of the Knickerbocker division was marked by a luncheon and reception by the Richmond County Automobile Club, at St. George, Staten Island, where Mayor Gaynor gave an address of welcome.

## STUDYING THE FIXED SPARK

Tests Indicate that it Lacks Value for Wide Speed Range—Holds Promise for Commercial Vehicles.

One of the features to which the demand for simplicity of vehicle control has given rise is the so-called "set spark" form of magneto. In this form, as is well known, the increasing voltage as motor speeds are increased is relied upon to produce a higher discharge at the spark gap of the plug.

DIAGRAM SHOWING ENGINE ACTION WITH SET SPARK MAGNETO

This, affording a rough equivalent to an advance in the timing of the spark, is found to give very satisfactory results in practice, especially when applied to machines of medium and low power. That such a system is not likely to afford the highest efficiency in service, however, is the general impression, since experience teaches that with the jump spark independent hand regulation of the spark invariably proves so very essential. Such being the case, a study of the matter which is reported by an English expert is informing, particularly since it indicates the particular advantage of the system in question when applied to motors intended to be run at pretty nearly fixed speeds for the greater part of the time.

The engine on which the experiments were made was a well-designed four-cylinder, built for a chassis having an excellent reputation for efficiency," says the authority in question. "It was run on a test bench, with an accurate electric dynamometer attached, the magneto being a Bosch D4 type, suitable for variable ignition. The engine was run at various speeds, and the horsepower very carefully measured under the different conditions of timing.

"In the first test the position of the contact breaker was very carefully adjusted at each speed to give the highest possible horsepower at that speed. The results obtained are given by the curve marked A A A in the diagram. It will be seen that the engine power constantly increased at an even rate.

"For the next test, the ignition was fully retarded and fixed. In this case the engine could be run at any speed between 350 and 1,050 revolutions, but the power given off was far below the first recorded—never, in fact, rising above 23.3 horsepower at the

highest speed obtained. The results are shown by the curve B B.

"In the third trial, the timing lever was placed in the midway position and there fixed. In this case it was found that the engine would not run slower than 600 revolutions per minute without knocking badly at full throttle, nor faster than 1,025 without loss of power. It will be observed from the curve C C that, again, the results obtained by variable timing were not reached.

"For the next experiment the ignition was fully advanced, and two very definite limits were obtained, viz., at 800 revolutions the engine knocked so that a lower speed could not be experimented upon, while at 1,050 revolutions the maximum recorded horsepower was obtained. D D illustrates the results.

"Lastly, a point was selected—625 revolutions per minute—and the position for ignition at that engine speed to give the highest horsepower reading was found. The timing was then locked, and the results of the test are shown by the dotted curve E E.

"Now if these curves be carefully studied, they prove, first of all, what anyone who

has driven a car or ridden a motor bicycle should know, that to obtain the best possible results the ignition must be varied by hand to correspond with the speed. Years ago the Daimler Co. adopted as the first simplification the expedient of linking up the spark lever with the throttle, so that as the latter was opened, the former was advanced, and vice versa.

"The expediency of this need not be discussed here; what we are concerned with is to what losses are we necessarily subjected by the employment of an invariable ignition? The curves B, C and D we may leave out of the investigation, as they show merely the results of an arbitrary setting of the ignition with no particular relation to what is required by the engine. But E and A taken together will tell us all we need to know; by a judicious selection of the point at which E touches A we may fix the sparking lever to give the best horsepower results of the average speed we wish to maintain in the car.

Suppose, to take an example, we assume the car will run generally at twenty-eight miles per hour, taking 880 millimeter tires and a three-to-one gear ratio, the speed will be 825 revolutions per minute. Let the ignition be fixed at the point which will give the greatest horsepower at this speed (825 revolutions per minute); then, when the engine is required for very fast spins on the level, there will be a falling off in power, and also at very slow speeds, but not such as will seriously interfere with its usefulness.

"One important thing must be borne in mind, and that is, that if the point in A at which the ignition is set be near either end of the curve the loss at the opposite end of the curve will be greater than shown in the example. The direction of the curves B and D proves this; for whereas B represents a fully retarded spark, and it very nearly coincides with A at the lower speeds, the difference at the high speeds is enormous, not more than two-thirds of the full power being obtained.

"Again, if the curve D, representing full advance, be produced downwards, although it closely corresponds with A at high speeds, at the low end, the efficiency will have greatly fallen off. Of course, in this case, the excessive advancement of the spark will prevent the engine running at all at low speeds, on account of the knocking which will ensue due to too early ignition of the charge."

While the results of the experiment quoted emphasize the natural conclusion that the invariable spark arrangement does not promote flexibility, they also afford a significant illustration of the utility of the system as applied to vehicles of a limited class. For all commercial cars, the desirability of simplifying the control mechanism to the lowest possible point generally is recognized. Furthermore, with machines of this order, engine flexibility,

while highly desirable, may be sacrificed in favor of other considerations. For example, it may be easier to teach an operator to shift gears than it is to train him to adjust the usual engine controls in such a way as to gain the maximum efficiency from the engine. The mere adjustment of the small levers to secure smooth action in the engine is not sufficient; a certain degree of skill is required which is bred only of close familiarity with the working of the engine.

The requirement of the delivery wagon, light truck and cab engine is for efficiency of two sorts, first the true, thermal and mechanical varieties, and second, that virtue which is called commercial efficiency. Commercial efficiency is not measured in percentages, but rather in terms of direct results; it involves a balance of all possible considerations connected with its use, and rises as general objections to the performance of the machine diminish. As far as operating may be considered in connection with the design of the machine, therefore, it is apparent that the set spark should be advantageous. That by experimental means it may be designed in such a way as to afford practically ideal conditions throughout the average active life of the motor, is sufficient to recommend it to serious consideration, under the governing circumstances.

#### Tire Lugs for Punctured Tanks.

Although it generally happens that a hole knocked in the bottom of an underslung gasoline tank puts an end to its usefulness for the time being, there are times when the puncture is small enough to be repaired by means such as usually are at hand on the car. A very good expedient in this connection is a tire lug, the flanged end of which readily can be hammered down into a shape roughly approximating that of the tank at the faulty point. The lug then can be lowered into the tank through the filler opening, a piece of stout wire being bent onto it so that it can be guided, and the stem forced out through the hole. The flange, being properly protected by means of a rubber gasket, the pressure of the wing nut generally will be found sufficient to draw the surrounding metal into place and close the opening with sufficient permanence.

#### Fender Manufacturer Makes Unusual Offer.

As a means of stimulating the sale of its fenders, a Western manufacturing concern has added an "automobile insurance" offer in connection with the devices. Should a car with one of the company's fenders have a head-on collision, the company not only will replace the fender if it be damaged, but will pay up to \$100 for damage to the car, provided a company representative is permitted to make an examination of the car before any of the repairs to it are undertaken.

## MOST MODERN "MOTOR PALACE"

**Studebakers Erect it in Chicago—Its Construction and the Many Conveniences Which it Contains.**

In Chicago the Studebaker interests finally have separated their horse-drawn vehicles from their self-propelled ones, which is to say that the Studebaker Automobile Co.'s branch in that city has been removed from the old location on Wabash avenue to the new building erected for its occupancy at Michigan avenue and Twentieth street, which is in the heart of "automobile

STUDEBAKERS' NEW CHICAGO STORE

row." The horse-drawn rigs will remain at the old place.

The new building, where Studebaker-Garford, E-M-F., Flanders and all other Studebaker cars now will be housed, is claimed to be practically the "last word" in modern automobile establishments.

The structure, which is shown by the accompanying illustration, occupies the northwest corner of Michigan boulevard and 21st street, and is of seven stories, reinforced concrete. Its dimensions are 75 x 175. It is equipped with a passenger elevator, a 16,000-pound freight elevator, and a 250-pound automatic elevator. The automatic elevator is under the control of the storekeeper and is for the purpose of transferring parts to and from various departments.

There are devices on each floor whereby all dirt, refuse, shavings, etc., are transmitted to the basement automatically. There is also a vacuum cleaning system throughout the entire building for cleaning purposes, the equipment including also a duplex air compressor with capacity sufficient to maintain ninety pounds pressure throughout the building.

The entire structure is provided with latest style wash and lavatory fixtures, including shower baths on some of the floors. There has also been installed an autogenous

system for welding and strengthening purposes.

In the basement there has been provided a chauffeurs' room, which contains all conveniences, such as telephone, writing materials and reading matter.

The salesroom is finished in silver oak, with mosaic hexagon tile, terra cotta color, the wall and ceiling decorations being carried out in a warm gray tone.

The furniture throughout the building is silver oak, to match the wood trimming.

The stock room is supplied with all-metal shelving. Some idea of the size of the room may be gained from the fact that it requires 14,000 pigeon holes to care for the various parts. On the ground floor, in the rear of the salesroom, there has been a room provided with 100 compartments large enough to take care of the various accessories of cars which are in the building for repairs, etc. The shop is equipped with all the newest and most improved machinery. Gasoline and oil tanks are entirely enclosed in concrete.

#### Grants Permission to Sell Unclaimed Car.

That a motor car may be sold for storage charges if the owner does not take it within a reasonable time after repair work on it has been completed, has been brought out in a court decision at Wilkes-Barre, Pa., on the petition of the Matheson Car Co., asking permission to dispose of an automobile sent to the company's factory by S. J. Levy of San Francisco, in December, 1907. The machine had been wrecked, and after the factory had made the necessary repairs Levy was notified as to the cost. He made no definite reply, however, and permitted the car to remain in storage ever since, until the storage charges amounted to \$145. The court decreed that the car be sold upon giving notice to Levy and advertising in the newspapers.

#### Special Freight Station for Motor Cars.

Although the railroads for some time have made provision for automobile shipments to the extent of supplying freight cars purposely designed in their dimensions to accommodate them, the Big Four railroad has gone further and is building one part of its new freight station at Columbus, O., with a special view to the handling of motor cars. A depressed track is being placed at the rear of the station, with a platform on the street level, at the foot of Swan street, in order that motor vehicles may be run directly from the street into the freight cars, the floors of which latter will be even with the street level platform.

#### Pay Extra for "Private" Motor Cabs.

Companies operating motor cabs for hire are finding profits in renting so-called "private" cabs, without taximeters or other indications that they are hired machines. Many patrons pay liberally for the "private" effect.

**CARBURETTER WITH THREE JETS**

**Palmer & Singer Employ Triple Jet Idea  
With Separate Venturi Tubes—In-  
genious Control by Cam.**

So great a range of demands is made on the carburetter for a large, multi-cylinder engine that the multiple jet type offers certain obvious advantages that are more difficult of ready attainment in the single jet type. The practical application of the multiple jet principle, however, is subject to a wide diversity of forms and methods, as is manifest in the new carburetters which make their successive appearance, each exhibiting an individual ingenuity in attacking the problem of perfect carburation at all speeds.

Of the recent developments in the multiple jet form, a striking and more or less radical example is afforded in the carburetter now employed by the Palmer & Singer Mfg. Co., of New York City, on the larger P-S cars, inasmuch as the device, which was designed by Charles R. Greuter, embodies a blending of mechanical and automatic control of the functioning of the various jets. As the product of a veteran designer and espoused commercially with extremely satisfactory results, the carburetter represents an accomplishment rather than a mere theoretical proposal designed as a possible contribution to the field.

The three main members of the device are shown in the accompanying illustrations, from which it will be seen that three jets are used. From the float chamber attached to the base member, the fuel is introduced into a circular chamber connecting with all three jets, an adjustment being provided for the primary or low speed jet. The three jet stems extend upward into three Venturi tubes correspondingly placed in middle or body section of the carburetter. The lower ends of these Venturi tubes are to be seen in the illustration, through the aperture for the air inlet. By reason of the fact that the tubes terminate at the top integrally with the main body shell, the only course for the air which is drawn in at the sides, is upward through the tubes.

The primary or low speed jet, which in the lower illustration is at the extreme left, is placed in a tube which is unobstructed at the top, but the tubes for the second and third jets are covered with weighted caps, provided with cages holding their stems so that the caps may rise as lift valves, opening with suction. The cap for the second jet is much lighter in weight than that for the third or high speed jet, making it correspondingly more responsive to increased suction. The action, therefore, is such that after the limit has been reached

for the capacity of the low speed jet, the second jet comes into operation to assist it and share the work, and when their combined capacity is exceeded the third jet

P-S CARBURETTER THROTTLE

also is called into play, its heavy cap being raised by the powerful suction of the engine at high speed. It will be observed that the top part of the carburetter, containing the throttle valve to the engine, bears a large cam attached to the stem,

BODY SECTION AND TUBES

the cam rotating with the valve when the latter is turned. The cam acts on two rocker arms, having roller ends, these arms being directly connected with fingers which rest directly on the tops of the weighted caps of the second and third tube openings.

JETS AND FLOAT CHAMBER

In the closed position of the throttle, the cam holds the rocker arms down, so that the fingers on the inside press rigidly on the cap tops, preventing the caps from

"flopping" either by road jars or momentary suction impulses. In this position only the primary or low speed jet is operative.

Partial opening of the throttle results in sufficient travel of the cam for it to clear the rocker arm that locks the cap over the second or middle speed jet. Thus released, the second jet is available for action when the cap over its Venturi tube is raised by the engine "pull" or suction. A complete opening of the throttle valve to the engine removes the cam face from both rocker arms, permitting all three jets to act. At the engine speed which follows from a complete opening of the throttle, the suction is so great that the caps over the tubes are held rigidly to the tops of the cages, with practically no fluttering.

To preserve the uniformity of the mixture, the openings in the three jets respectively are proportioned to their duties, having in mind the suction conditions under which they act. The first or low speed jet has a comparatively generous fuel opening; the second jet a lesser opening; and the third jet, which is in action when the suction draft through the Venturi tubes is at its greatest, is accordingly limited. Among the advantages claimed for the carburetter, in addition to its providing ample and uniform gas mixture throughout the whole range of regular running conditions, is the fact that in hill climbing, when the throttle is well open but the engine is at a lessened speed because of its extra work, the mixture is free and properly proportioned, the main duty falling on the primary jet with its ample fuel opening, while the air flow through the second and third tube, because of the weighted caps, is permitted only when the suction is sufficiently great to draw the proper proportion of fuel from the jets which they surround. This is an advantage not possessed by many carburetters and one which it is particularly desirable to achieve.

**How Owen Will Cover the Country.**

If at the end of three months there are any motorists or prospective motorists who have not had a practical road demonstration of the Owen car they will have themselves to blame, for in order to better familiarize the motoring public with the merits of their product the Owen Motor Car Co., Detroit, Mich., are planning to send out a fleet of demonstrators to thoroughly cover the entire country. In fact, two of the missionaries already have started—C. E. Wheeler, who will cover the Eastern states, and A. D. Caldwell, whose territory includes the section bounded by Buffalo and Pittsburg on the east and the Mississippi river on the west. The schedules mapped out for these cars calls for over 10,000 miles of travel, while others will leave shortly to visit the south, southwest, middle west, northwest and Pacific Coast sections.

## CONVERTIBLE BODY IN NEW FORM

Private Owner Evolves His Own Design—  
How it Affords the Open and  
Closed Effects.

It continues to be more or less of an enigma that the convertible type of automobile body has not been developed to a greater extent, and, furthermore, that such bodies of this description as have been offered have not proved more popular. Like the family horse, the convertible body is intended for the manifold purposes of domestic service; as such is the case, there is no apparent reason why it should not be in more common use. But since so many of the manufacturers offer nothing in this

drops on the flat ledge without any difficulty. Of course, if it be desired entirely to enclose the car, it can be extended forward in just the same way without the least difficulty. In fact, one can have any sort of top and any sort of body one likes so long as one preserves the flat edges right around the body.

"It may be said the back would look ugly when the car was used as an open car, but it should be understood that the top of the back panel is entirely hidden by the 'hood' except when the 'hood' is up, and, although I do not claim the ledge as a line of beauty, I think that it is so practical that it will not offend the eye in the least if the design be well carried out by a clever and artistic designer. . . . I think my idea will conduce to lightness because it gives such a good bed for the top to rest

an adjustable sliding member. The result is that when repairs are to be made to the spare tire, it may be swung forward and outward into an accessible position, where it is held securely. Means whereby the rim may be rotated without impairing its fastenings to the carrier are intended to facilitate repair work.

### "Phenomenon" that Fooled Experts.

Much discussion has arisen abroad over the phenomenon discovered by one motorist which took the form of an apparent and very appreciable back pressure issuing from the filler opening of the gravity fuel tank and when the cap was removed and the engine running. It being observed that the little puffs of air, which could be distinctly felt by holding the hand close over the opening, increased in volume and rapid-

SUGGESTIVE METHOD OF MOUNTING ANY FORM OF CONVERTIBLE BODY

line, or only a distant approach in the shape of interchangeable bodies, it follows that the persistent owner sometimes is forced to develop his own convertible shape, as is instanced by the design here illustrated, which represents a foreign notion.

In a general way, the idea used is nothing more nor less than that of the old-time "balloon" top. The general details are altogether different, however, and introduce a desirable feature in the way of strength which is promised in a degree that many of the early demountable tops failed to possess. The essential novelty in the construction is the use of the horizontal molding running entirely around the lower portion of the body. This molding provides a firm seat for the base of the top structure, and is so formed that the securing of the top is assisted very materially by the use of dowels which fit into pockets in the molding and secure positive alignment of the abutting surfaces. Its inventor points out its advantages thus:

"Hitherto these detachable tops have followed the more or less wobbly contour on the upholstery or a ledge at the side of it, and have looked 'make-shifty' in consequence. With my device the top is a workmanlike, flat-bottomed construction which

on, so that it is not strained in any way once it is in position, but I may as well confess I have not designed this thing on account of its practical advantages, but because of its appearance, for, as I have said, the ordinarily convertible body always presents the appearance of being a make-shift."

### New Type of "Spare" Carrier.

One difficulty with the average spare rim and tire carrier is that it is not sufficiently robust in construction to permit replacements to be made without removing the extra rim from the running board. Appreciating the inconvenience of this weakness, a well-known foreign tire builder has developed a special form of carrier which is so designed that tire changes and repairs may be made without difficulty while the rim is still in position and firmly secured to the stand. The supporting device consists of a double circular frame which is provided with quick-acting clamping means for securing the spare rim. Instead of being positively attached to the running board and side of the body, as commonly is done, however, it is mounted on the board by means of a pair of swinging links, and attached to the side of the body by

ity with the increasing speed of the engine, it was immediately conceived that some mysterious relation existed between the engine and the liquid itself. Explanations advanced ranged from the sublime to the ridiculous until one old-time driver came to the front and pointed out that as the tank was unstayed, its walls were subject to vibration. The result of this, as he explained, was that the trembling of the car as the engine was speeded up, caused the contents of the tank to be agitated to such an extent that the air currents observed were produced.

### Irish Cab Drivers Object to Motor 'Buses.

Exciting scenes are reported to have occurred at the town hall in Cork, Ireland, when the town council endeavored to pass a bill granting a franchise for the establishment of a motor 'bus line. Cab drivers and cab owners, brandishing whips, stormed the town hall and cleared it out, chasing the aldermen in all directions. Notwithstanding this violent opposition on the part of the cab drivers, the franchise will surely be granted, as it would be of great value to the community. The entire board of aldermen is said to be in favor of the bill permitting the motor line.

**GREEN THE MOST POPULAR SHADE**

**Pierce-Arrow Statistics Show that it has  
"Nosed Out" Blue—Red Finishes  
Steadily Losing Favor.**

According to statistics prepared by the Pierce-Arrow Motor Car Co. of Buffalo, N. Y., the taste of purchasers in respect to colors has changed since 1909. Blue has been displaced by green as the most popular shade, while red steadily has lost ground.

Most of the manufacturers of motor cars insist that a few "standard" colors be adhered to, but the Pierce-Arrow company encourages each buyer to exercise individuality and to specify the color he prefers. In this manner the company has succeeded in obtaining a fair criterion of the popular taste, and accurate information as to just what the public has demanded in the twelve months just passed. While during the year ending June, 1909, blue cars were most popular, with green a close second, the figures for the ensuing twelve months show green to be the general favorite, 30.42 per cent. of the cars manufactured by this company having been finished in that color. Blue comes next with 28.77, and wine-color third with 17.46 per cent. These figures show a decided gain for the more subdued colors, green and blue, and a corresponding decrease in the red shades. Bright red cars now form only 6.42 per cent. instead of 10.88 last year. Other colors and their percentages are: Brown, 4.96; gray, 4.83; lead, 2.84; black, 1.33; miscellaneous, 2.98. The latter classification includes purple, carmine, yellow and white. In 1909 red and wine combined provided the finish for 31.97 per cent. of all the Pierce-Arrow cars manufactured, while for the 1919 product these colors were used on only 24.86 per cent.

**Features of the New Royal Brake.**

Like other motor car parts, the brakes have become the subject of specialization by manufacturers peculiarly equipped for the task of producing them, and because of this they have been given a development which probably exceeds what would be possible in the ordinary course by any individual automobile maker. As the crystallization of long and broad experience in motor car braking, the present day product of the brake manufacturer is a highly specialized mechanism, the simplicity and efficiency of which is not happy accident. Most recent of the brake products of the Royal Equipment Co., of Bridgeport, Conn., is the new duplex Royal brake, shown in the accompanying illustration, and in which the retarding effect is equal in both directions of rotation of the drum. The wrap-

ping or winding effect of a flexible band surrounding a drum is made use of. One end of the flexible band is fixed while the operating force is applied to the other end in the direction of the rotation of the drum. In order to secure this effect in both directions, means are provided by which

either end of the band automatically becomes the fixed end, depending upon the direction of rotation.

**Hinged Coils for Curved Dashboards.**

Where curved dash construction is used, the quarters for the dash coil are apt to be so cramped as to nullify the advantages ordinarily obtained from the use of the unit coil type, as the space above the coil box may be so limited that the units cannot be removed without taking the box itself off

the dash. As a remedy for such cases, the Connecticut Telephone and Electric Co., of Meriden, Conn., has placed on the market a new type of hinged bracket coil, designed especially for cramped motor car dashes. As shown by the accompanying illustration, which gives a view of the Connecticut hinge bracket coil mounted on the curved dash of a Stevens-Duryea car, the coil box may be swung outwardly from its lower fastening. This permits the easy removal or replacement of any of the individual units, which is one of the most important points in connection with Connecticut coils, as all the coil units are interchangeable without touching a wire connection.

**SMART TRICK OF A MILLIONAIRE**

**How it Enables Him to Obtain Trade Prices  
—Garages and Companies Not Always  
What they Seem.**

Not all ostensible dealers and garaging concerns are exactly what they appear to be on their letterhead, owing to the fact that owners who boast a number of cars have hit upon the scheme of running their own private garages under firm names which would indicate that they are dealers and therefore entitled to dealers' prices. While it is common enough for owners to have two or three cars, there is an astonishing number who have from six to a dozen, and they find it well worth while to operate their garages on the dealer's basis, although they themselves are the only customers they have, with the exception of taking care of the cars of visiting friends.

In visiting the trade, the traveling man for one of the big eastern jobbers was taken to task by a dealer because his house sold goods at dealers' prices to a nearby "automobile company" with a very business-like title. The dealer protested that the other jobber should not grant trade discounts to that particular firm.

"Well, I don't see why we shouldn't sell them," the traveling man declared with some heat. "They certainly do a big business and they buy a lot of goods from us. They pay their bills promptly, too, taking every discount, so I can't imagine why you think we shouldn't sell to them."

"Did you ever try to garage a car there, or to buy any supplies at retail?"

"No," answered the traveler.

"Try it some time," continued the dealer, "and you will find that it is a case of nothing doing. They will turn you away politely but firmly. It is nothing but a private garage, owned by a millionaire sportsman, who has 23 cars of his own right in that garage, not to mention those he may have in other parts of the country and in Europe. Those 23 cars would keep any place busy, and the garage probably buys a great deal more than many legitimate dealers, but if you sell to it at dealers' prices in the future, you will not get any more orders from us."

**Insurance Policies to Emphasize Lock Nuts.**

As a means of emphasizing the dangers attending travel on vehicles and equipment that are not fitted with Columbia lock nuts, the Columbia Nut & Bolt Co., of Bridgeport, Conn., has presented leather bill-folds or purses to various men in the trade, each bill-fold containing a free accident insurance policy. The policy is for \$2,500 and is good for a year, with no payments of any kind by the recipient.

**Pastor's Plea for "Ground-Flying Angel."**

Texas presently may be able to boast of a negro preacher who attends to the wants of his flock from an automobile, if the Columbia Motor Car Co., of Dallas, harkens to the plea of one dusky member of the cloth, who signed his name B. Tyrrell and wrote from Blossomdale, Texas. Here is the letter:

"Please advise me how to buy a motor car. I am a colored pastor, am getting well on in years, have a large congregation, am wearing out getting around to look after them.

"Though I get a very moderate salary, preaching to ex-slaves and the children of ex-slaves, it popped into my mind to write to you and ask you whether you will sell me a second-hand car at the very lowest notch possible.

"Of course, I could not think of trying to buy a new car, nor even so much as dream of it, for my people are poor and I was born some time in the middle of last century—all of us poor.

"At any rate, please quote me the price of one of these ground-flying angels, borne on the wings of our new-dawned century. I would be a flying advertisement for you, for our white people would surely buy if they saw me flying before I die. Help me out if you can. Think and look over your stock, then let your mind be generous toward one of my Master's servants."

**Philadelphia May Have Municipal Garage.**

Judging by the interest being taken in the matter, Philadelphia, Pa., will soon have its official municipal garage, repair shop and storage room. Mayor Reyburn this week transmitted to the City Council a request from Director Clay that the city property at 711 to 715 Filbert street and at 42 North Seventh street be sold, and the proceeds used for the purchase of a site and the erection of a three-story building for municipal garage purposes. A site on Washington avenue, where a railroad switch may be obtained, was suggested as preferable. The property to be sold is valued at \$95,000.

**Cow-Killer Files a Counter Claim.**

An unusual counter claim was made in a damage suit tried in Poughkeepsie, N. Y., this week. James J. Dunbar of Pine Plains has been sued for \$250 for the death of a cow belonging to Harry Gray, which had to be killed after being run into by the former's automobile. Dunbar stated that the accident was unavoidable, as the cow jumped at his car and bent the mud guard and lamp, for which he makes a counter claim for \$10.

**Harris County Owns the Most Motor Cars.**

Harris county, which is in Texas, feels real proud these days. The reason is because that county, according to official re-

turns from the various officers, has been found to possess more automobiles than any other county in the Lone Star state. In round numbers Texas has 5,000 automobiles, and the dealers claim that fully 25 per cent. have been sold since the first of the year. Of the total number of registration Harris county leads with 875 cars; Dallas county is second with 789 cars.

**Post Office Moved by a Motor Car.**

Time was when the moving of a house or similar structure would have necessitated many hours and sometimes even days of arduous labor with a horse and capstan ar-

MOVING THE FALL RIVER (WIS.) POST OFFICE BY MOTOR CAR

range. With an automobile the process is simple, as was recently proved in Fall River, Wis., where, when it was desired to move the postoffice building to a location two blocks distant, T. D. Babcock came to the rescue with his 28 horsepower Franklin touring car. After the structure, which measured 20 by 32 feet in ground dimensions, had been raised and set on rollers, Babcock's automobile was attached to the building by a tackle, and with the automobile pulling steadily the postoffice was rolled up the street and pulled to its new foundations quickly and without mishap. The building contained a safe which weighed nearly a ton, and neither this nor any of the office fixtures were removed during transit.

**Uses Motor Car to Assist Map Making.**

Disclosing a highly utilitarian and commercial use for a touring car, Rand, McNally & Co., the map makers and railroad printers, are using a six-cylinder machine in preparing revised state survey maps. It is stated that by means of the car the cost of obtaining the necessary data is greatly reduced.

**Teamsters' Union to be Motorized.**

Giving evidence of their perception of of the trend of the times, the International Brotherhood of Teamsters has taken steps to change the name of the organization to the "International Brotherhood of Teamsters and Chauffeurs," and to secure alterations in the charter which will permit the admission of chauffeurs to membership. This action follows a vote which was taken at the last national convention of the brotherhood, held in Detroit last September. It was shown that within the last few years large numbers of teamsters and drivers of delivery wagons in the big cities

have been "broken in" to the operation of motor wagons, trucks, taximeter cabs and other commercial vehicles.

**Oklahoma Family on Camping Tour.**

Frank Bradfield, who, with his wife, three children and another passenger, left Enid, Okla., a week ago for a leisurely tour to Charleston, S. C., and thence by boat to Galveston, Tex., returning to Enid in the automobile, has evolved a unique appliance that may come in handy in case of breakdown or should the car run out of gasoline between towns. It is a telephone and by means of an extension jointed rod he can tap a telephone wire at any point along the route and call for assistance. The party is carrying a complete camping outfit, as most of their nights will be spent under an oiled silk tent pitched by the roadside. The trip will be completed in September.

**Indiana's Record in Registrations.**

Automobile registrations for April and May in Indiana numbered 3,564. Of the number 1,840 were registered in May, the largest number ever recorded in one month since the registration law was enacted.

THE NEW  
**Rambler**

**T**HE Fifty-four Toy Tonneau is a mid-season New Rambler model. It is an evolution from the Close Coupled model, designed for the same demand, but a little more roomy.

Its advantages are low seats, two inches longer than usual from front to back. Seat cushions tilted and rakish seat-back to correspond. Body smaller and lighter than the touring car but tonneau roomy enough for three people of average size. Three inches more leg room in front than touring car. Rakish steering column.

With five lamps, Prest-o-Lite tank or generator, magneto and storage battery, horn and tools, \$2,250. Top with side curtains, \$100. Wind Shield \$40. Spare Wheel \$85.

**RUBBER GOES DOWN; THEN UP AGAIN**

**Rests at a Price Well Below its \$3 Mark,  
However—Why Manufacturers Still  
Refuse to Buy.**

After having touched the \$3 per pound mark which was predicted for it, rubber has executed a downward slide and then an upward swoop, until now it is at about \$2.35 per pound, after having gone as low as \$2.15 per pound three weeks ago. Although the fact that it is lower than at previous times is taken as a promising symptom, it is recognized that if purchasers were to go heavily into the market the price again would soar. For this reason there is comparatively little buying, and in the face of both a lowering and a raising of prices the tire makers and others are keeping a more or less general compact not to buy.

In analyzing the situation, Horace De Lisser, general sales manager of the United States Motor Co., and former president of the Ajax-Grieb Rubber Co., finds reason to believe that the Brazilian government is largely responsible for the prices at which rubber is being held. He thinks that because the situation is largely artificial, it will be met successfully by opposing strategy on the part of rubber buyers.

"In the same way that it dabbles in the coffee situation, the Brazilian government is encouraging rubber growers to hold their product in storage for the sole purpose of raising prices," DeLisser declares. "The crude rubber is stored, money is advanced upon it, and the system lets it go when prices seem satisfactory to it.

"There was a time when if a grower collected 50 tons of rubber he was glad to sell it at competitive prices prevailing in the open market at the time and regulated by natural conditions of sale. The para rubber output is now about 40,000 tons, and at the present time there is about 4,000 tons in storage in South American warehouses, and at the tag-end of the season when the

product is usually much lower. There is no doubt but what the holders expect the market to rise still higher, and this desire is accentuated by the attitude of the manufacturers, who are holding out for a drop. With rubber at \$5,000 a ton, the manufacturers believe that present supplies in hand will enable them to hold out until the 4,000 tons now stored will be increased by the new crop to 25,000 tons or more. In this case such a load would cause the market to become uneasy and finally break with the flood of rubber that must come, thereby depressing prices. In other words, we anticipate a drop only when the fellows down below have more rubber than they have money."

**Jeffery Incorporated at \$3,000,000.**

With the incorporation of a \$3,000,000 company under Wisconsin laws, the business of Thomas B. Jeffery & Co., of Kenosha, Wis., has undergone a slight change in name, and hereafter will be known as The Thomas B. Jeffery Co. This step is in accordance with the provisions of the will of the late Thomas B. Jeffery, who indicated that the business should be incorporated. The ownership of the new \$3,000,000 company is vested entirely in the Jeffery family and no change occurs in the management or policy.

**Roe Succeeds Peer as Reo Secretary.**

E. J. Peer, who has been secretary and treasurer of the Reo Motor Car Co., of Lansing, Mich., has resigned, and will leave shortly for an extended tour including the Pacific Coast. He has been succeeded as secretary by J. Edward Roe, cashier of the Lansing State Savings Bank, who will give up the latter position for the new connection. Donald E. Bates has been elected treasurer of the Reo company.

**McGuire Heads Republic Rubber.**

John McGuire, formerly connected with the B. F. Goodrich Co., has been elected president of the Republic Rubber Co., of Youngstown, O. He succeeds Warner Arms, who recently died.

**KEEPS E. V. RECEIVERSHIP ALIVE**

**Selden Litigation Necessitates its Continuance—Receivers File Report Showing Present Status of Affairs.**

By no means the last has been heard of the Electric Vehicle Co., of Hartford, Conn., judging from the nature of an order, on the 17th inst., by Judge Cross of the United States Circuit Court for the District of New Jersey. Although in practical affairs the company has been succeeded by the Columbia Motor Car Co., the receivership manifestly is destined to linger for some time to come, if for no other reason than that the Selden patent controversy involves the Electric Vehicle Co.'s relations to George B. Selden and to the Columbia Motor Car Co., and the receivers will be continued until these relations are clearly established in court. Henry W. Nuckols and Halsey M. Barrett, the receivers, have filed their seventh report, dated June 16, and the court order is for creditors and stockholders to show cause, on June 27th, at the State House in Trenton, N. J., as to why the report should not be approved and the receivers permitted to follow out the recommendations and course of action that they have outlined; and as to "Why an order should not be entered herein continuing the said receivers until the said proceedings relating to the Selden patent have been concluded, or until such other or further time as to the court shall seem advisable." There are nine creditors whose claims have been disallowed by the receivers, and they are given opportunity to show cause why the disallowing should not be approved.

In the report of the receivers it is shown that they have completed their administration except in so far as it is necessary for them to act in the distribution of the sum of \$22,892.00 remaining in their hands; that they have acted upon all of the claims filed with them by the creditors and have paid a dividend of 20 per cent. upon all claims al-

**BLOCK TIRES LEGAL IN JERSEY**

**Makers Get a Victory in Supreme Court—  
Driver's Conviction Set Aside— Law  
Regarding Automobile Tires.**

Block type or "sectional" tires, such as are extensively used on commercial vehicles, do not violate the New Jersey state law, after all, and may be used in that state without legal penalty, according to a decision by Judge Minturn, of the New Jersey Supreme Court, in setting aside the recent conviction of Paul J. Kubler, a driver who was fined \$25 and convicted by a Passaic police justice for driving a machine with block tire equipment. Kubler was prosecuted by Assemblyman Edward Thomas Moore, of Passaic, acting as a state inspector of motor vehicles, who alleged that Kubler's car, owned by the Hackett Motor Car Co., violated the state laws by reason of its having rubber blocks on the circumference of its wheels.

Specifically the violation was claimed to be of Chapter 224, Section 6, of the state laws of 1910, approved on April 9, 1910, and reading as follows:

6. No motor vehicle tire shall be fitted with a chain, nor shall any tire upon any motor vehicle be constructed of or have thereon any blocks, hobs, studs or other projections beyond the periphery of the tire forming the tread or traction surface of such tire, and which shall extend beyond three-eighths of an inch from the periphery of such tire, when such motor vehicle shall be used upon gravel, macadam or other made roads, except upon natural dirt, asphalt, cobble, Belgian blocks or vitrified pavements, provided, however, that tires may be fitted with a chain when used upon roads covered with a coating of at least one inch of snow or ice.

A petition was filed by Kubler with the Supreme Court, for a review of his conviction by Thomas P. Costello, the police justice for the city of Passaic, and Judge Minturn on the 10th inst., in his opinion stated that "the construction and use of the tires on the motor car driven or used by said Kubler, to wit: Kelly-Springfield sectional tires of twin type, is not a violation of Section 6 of the act." It therefore was ordered that Kubler's conviction be set aside and his fine, as imposed by the Passaic police justice, be remitted.

The decision is in the nature of a valuable victory for the Consolidated Rubber Tire Co., of New York City, which makes the tires in question, as arrests and fines have been imposed on drivers using these tires in a number of New Jersey cities and towns, including not only Passaic but also Hoboken, Rutherford and other places. The action of the Supreme Court is looked to as preventing further prosecution of the company's customers. It was shown to the court by the Consolidated attorneys that the effect of the rubber blocks is to squeeze

together under pressure, making a smooth, continuous tread on the road surface, and that it would be necessary to attach hobs or the like to the tread in order to violate the statute.

**Atlanta Company Quietly "Folds its Tent."**

Although the Southern Motor Car & Truck Co., of Atlanta, Ga., occupied luxurious salesrooms at 158-160 Marietta street, and made a brave outward show, its business does not seem to have been very satisfactory from a financial point of view. After considerable bickerings with the landlord and other creditors, the southern company decided to quit the automobile business, and decamped. Despite their evident hurry to leave, the leading spirits of the enterprise tarried long enough to carry away everything of the slightest value, leaving to the creditors a perfectly bare and empty building. Judge Ridley, the day before the "flight," had sent a bailiff to attach a considerable part of the equipment, and the latter actually took possession of some valuable machinery and accessories. Returning the next morning with a wagon to carry away the attached goods, and intending to attach the rest of the equipment, the bailiff found the doors open and the salesrooms bare. Even the goods he had attached were gone with the rest. The officials of the Southern Motor Car & Truck Co. at present are very much "wanted" by the angry bailiff.

**Sent Money but Received no Car.**

In the offering of automobiles on the mail order plan, there is danger not only to the confiding souls who are tempted to send their money, but also to those who do the offering, especially in the event of complaints that the motor cars do not arrive in due course after the money has been forwarded. That this danger is exceedingly real is probably felt most keenly of all at the present time by Earl R. Ryno, who now is being tried in Detroit, Mich., on the charge of fraudulent use of the mails, having been indicted by the Federal grand jury. About two years ago Ryno was in business in Detroit under the name of the Belle Isle Motor Co. Complaints were made to the postoffice department from persons who said that they had sent money to the company but had failed to receive the automobiles for which the money was intended. Investigation by a postoffice inspector resulted in Ryno's indictment.

**Hartford Suspension in Chicago.**

The Hartford Suspension Co. of Jersey City, N. J., has opened a Chicago branch for the handling of Truffault-Hartford shock absorbers. The branch, which is under the management of William P. Politizer, is located at 1458 Michigan avenue, and boasts a well equipped machine shop for making attachments of shock absorbers to cars.

lowed by them, or by the respective courts appointing ancillary receivers for the company, or by any of the ancillary receivers; that the only claims which have been disallowed either in whole or in part are those of C. A. Blake, Kenyon & Kenyon, B. Michael Co., Crucible Steel Castings Co., Limousine Carriage Mfg. Co., W. H. Leland & Co., New York Transportation Co., W. F. Parker and Mrs. Anna M. Bradley, and that these claimants were all notified on June 19 of the action taken upon their claims and that no appeal has been taken from the allowance of any of the claims; that the State of New Jersey has levied a franchise tax of \$4,679.75 for the year 1910 upon the Electric Vehicle Co., which franchise is payable on July 1 and will thereafter bear interest at the rate of 12 per cent. per annum until paid; that Herbert Lloyd, Kenneth B. Schley and C. Wendell Woodward, the reorganization committee of the creditors and stockholders of the Electric Vehicle Co., representing approximately 98 per cent. in interest of the creditors and approximately 88 per cent. in interest of the stockholders, to whom the assets, property and business of the receivers (with the exception of cash), and of the company, have been sold under a previous order of the court, and the Columbia Motor Car Co., a corporation of the State of Connecticut, to which as nominee of the reorganization committee the assets, property and business were transferred and conveyed, have each requested that the receivers be continued during the pendency of the appeals about to be taken from the decrees to be entered in the United States Circuit Court for the Southern District of New York to establish the validity of the Selden patent, an exclusive license to which was transferred and conveyed to the Columbia Motor Car Co. as part of the assets and property.

Under the circumstances, the receivers ask that their report may be in all things confirmed, ratified and approved, and that the payments made by them and the actions taken by them therein set forth, including the sale of the business, assets and property to the reorganization committee and the transfer and conveyances of such business, assets and property to the Columbia Motor Car Co. shall be affirmed and approved; that out of the moneys in their hands there may be allowed and paid to them and their counsel such sums for their services and disbursements as to the court shall seem proper; that they shall be instructed as to the action to be taken by them in response to the request of the reorganization committee and the Columbia Motor Car Co., and as to the distribution, if any, to be made by them at this time of the balance remaining in their hands after the payment of the allowance aforesaid; and that they may have such further and other instructions in the premises as to the court shall seem proper.

## IN THE RETAIL WORLD.

W. A. Grinard has sold his garage business at Olean, N. Y. Joseph Hutchins is the new owner.

Kuhns Bros. just have opened a garage in the Armory building at the corner of Phelps and Front streets, Youngstown, Ohio.

Hurley Bros., of Seaford, Del., are erecting a garage on Market street. The building will be 50 x 100 feet, and cost about \$3,000.

The Geyer Sales Co., is the style of a new accessory firm in Dayton, Ohio. It is located in the Bimm building, corner Main and First streets.

Billings & Lyons is the style of a new firm which has opened up at 121 West Seventh street, Topeka, Kans. Pullman cars constitute their leader.

The Southern Motor Sales Co., of Louisville, Ky., has moved into roomier quarters at Third avenue and Breckinridge street. The firm handles the Cole "30."

T. T. Rocket is building a garage at 3609 Lancaster avenue, Philadelphia, Pa. The building will be 50 x 65 feet, one story high and will cost about \$5,000.

The Glenn County Garage Co., of Wilcox, Cal., is building a brick and cement garage, to cost \$6,250. General repair work and renting will be carried on.

A. C. Hull, of Oakland, Cal., has sold his automobile business to F. G. Becker, of Chicago, and S. McIver of Oakland. Maxwell and Columbia cars are featured.

C. H. Farnum of Baraboo, Wis., has sold his automobile business to W. W. Stackhouse and R. E. Sherman. Jackson and Fuller cars will be shown by the new owners.

Under the style the Consolidated Motor Co. a new garage has been opened at the corner of Avenue C and 21st street, Birmingham, Ala. W. A. Peckham is the manager.

The Nolan-Rieke Motor Car Co., Kansas City, Mo., is erecting a garage at 3422-26 Broadway, to cost \$15,000. The building will be 90 x 160 feet, and is to be ready by September.

Crowley & Grindle have opened a garage in Golden Gate avenue in San Francisco, Ca., under the style the Auto Service Co. The building is 82 x 138 feet, two stories high, and cost \$15,000.

The St. Louis Garage Co., of St. Louis, Mo., will open its new quarters on the corner of Manchester and Sarah avenues on July 15. The company handles the Whiting cars and Johnson trucks.

S. W. Ramalay has sold the Grand Avenue Garage, St. Paul, Minn., to H. K. Harrison, president of the Harrison Machine Co., of that city. The name of the concern will remain the same as heretofore.

The American Garage Co., St. Louis, Mo., has taken over the interests of the Whitaker Motor Car Co., and will be located at Nos. 5875-81 Delmar avenue. Rambler and Everitt "30" cars will be shown.

Under the style the Maple Garage, John E. Lathrop of Hartford, Conn., has "opened up" on Ellington street, South Windsor, Conn. The building is 36 x 64 feet, 30 feet high and cost \$8,500. Moline and Schacht cars will be featured.

Bloomington, Ill., is to have another garage. C. M. Coats, whose automobile business is located at South Water street, is building an additional garage in LaSalle street. The new place will be 75 x 180 feet and two stories high.

The Stafford Motor Car Co.'s garage, corner Seventh and Quincy streets, Topeka, Kan., has been bought by Albert E. Jones and Theodore Johnston of Emporia, Kan. The new owners will continue the business under the style the J. & J. Motor Car Co.

Work has been started on the new garage to be erected on the corner of Wall street and Ticoga avenue, Corning, N. Y. The business is owned by Baker & Hillman, and the building is to be 70 x 63 feet, two stories high, of brick, and will cost \$7,000.

Another link in the chain of Foss-Hughes garages, spread over the Middle Atlantic States, is the new establishment at 1201 Gilpin avenue, Wilmington, Del. Frank A. Alderman is the manager of the branch, which handles the Pierce-Arrow line exclusively.

The Philbrook Machine Co., composed of A. H. Philbrook and W. Cott, has built a machine shop and garage at the corner of Fifth and Porter streets, Okmulgee, Okla. The structure cost about \$5,000 and will serve to house Buick cars, for which the company is agent.

Petition in bankruptcy has been filed by the Beck & Gregg Hardware Co., and other creditors, against the Georgia Garage Co., of Atlanta, Ga. Judge Newman appointed R. C. Paterson receiver for the defunct company, which was owned and managed by W. H. Millen.

Owing to the growth of its business, the I. M. Allen Co., Brooklyn and Long Island distributor of Stevens-Duryea cars, has leased larger quarters at 322 Livingston street, Brooklyn, N. Y. The present establishment at 116 South Portland avenue will be continued as a repair shop.

The Hearne Motor Co., which is owned and operated by J. G. and Thomas McK. Hearne, has moved into more commodious quarters at the corner of 15th and McCullough streets, Wheeling, W. Va., where it has 6,000 feet of floor space. Peerless and Ohio cars are handled by this firm.

The City Motor Car Co., one of the new concerns in Houston, Texas, has taken possession of a two-story garage, 50 x 100 feet,

which has been built specially for it at a cost of \$20,000. Pittsburgh "66" cars and Johnson commercials will be featured. C. O. Wier and E. F. Holmes are in charge.

The Chalmers-Detroit Motor Car Co. of Ohio has been reorganized under the name of the Ooley Motor Car Co., with \$25,000 capital. Benjamin Ooley and Ernest Ooley, the new owners, have added the Packard line to the Chalmers-Detroit and Hudson, for which the old company was agent in Dayton.

Lewis Miller is erecting a new garage at the corner of East Eighth street and Hawthorne, avenue, Portland, Ore. The building is 50 x 75 feet, two stories. In the same city West Bros. are building a garage, 50 x 200 feet, costing \$25,000; while John Kerrigan and R. W. Lloyd are opening up garages on Union avenue near Wasco street.

## Former Partners Again Join Forces.

Dorgille Libby, Jr., and Eugene S. Miner, the two pioneer automobile builders of San Francisco, Cal., have again joined forces, after a period of separation subsequent to the destruction of the Sunset Automobile Co.'s plant by fire in 1906, an enterprise of which they were the owners. Miner remained in San Francisco, while Libby has been acting in a designing and engineering capacity for the Atlas Motor Car Co., of Springfield, Mass., the Chalmers Motor Co., of Detroit, and other concerns in the East. The re-united partners have taken a small factory at 1417-29 Van Ness avenue, where they will build cars to order and also do rebuilding.

## Falcar Likely to Leave Chicago.

The Fal Motor Car Co., of Chicago, Ill., is casting about for a factory in one of the Illinois smaller cities, and the selection will depend to a great extent on which will offer the most substantial and prompt inducements. Waukegan, Ill., is considering the company's proposition, and a mass meeting has been called to determine whether its citizens are willing to absorb \$200,000 worth of the company's stock.

## Dayton Airless Goes to Detroit.

The Detroit Airless Tire Co., recently incorporated under Michigan laws with \$1,500,000 capital, is to succeed to the business of the Dayton Airless Tire Co., of Dayton, O., from which city operations will be transferred to Detroit. A new plant will be built, which is expected to be in operation in September.

## MacMullen Joins the Overland Staff.

B. J. MacMullen, who for three years has been connected with the New York branch of the White Co., of Cleveland, O., has gone with the Overland Selling Co. He will be under George W. Bennett, the general sales manager of the Willys-Overland Co., of Toledo, O.

**THE WEEK'S INCORPORATIONS.**

Centralia, Wash.—Hub City Auto Co., under Washington laws, with \$3,000 capital.

Rollingstone, Minn.—Rollingstone Auto Co., under Minnesota laws, with capital not given; to deal in automobiles.

Detroit, Mich.—Michigan Magneto Co., under Michigan laws, with \$25,000 capital; to manufacture magnetos under letters patent.

Hammond, Ind.—Hammond Automobile Club, under Indiana laws, without capital. Corporators—A. M. Turner, J. G. Ibach and others.

Cleveland, Ohio—American Dismountable Rim Co., under Ohio laws, with G. B. Harris, E. A. Close, I. M. Forschnet, S. M. Davis, G. B. Clement.

Terre Haute, Ind.—Smith Motor Co., under Indiana laws, with \$25,000 capital; to manufacture automobile parts. Corporators—W. B. Smith, E. B. Smith, M. B. Shelton.

Clinton, Mass.—Connery Transportation Co., under Massachusetts laws, with \$5,000 capital; to do general automobile business. Corporators—J. F. Stratton, J. R. Connery, W. H. Connery.

Indianapolis, Ind.—Midway Automobile Co., under Indiana laws, with \$3,000 capital. Corporators—Oliver G. Thomas, C. D. Paidrick, F. L. Wiltshire, A. D. Thomas, George W. Snyder.

Gaylord, Mich.—Gaylord Motor Car Co., under Michigan laws, with \$100,000 capital; to manufacture automobiles. Corporators—A. B. C. Comstock, Frank A. Kramer, John L. Pelton, Lee Metford.

Boston, Mass.—Richard A. Crooker Co., under Massachusetts laws, with \$10,000 capital; to do general automobile business. Corporators—Th. M. Josselyn, Richard A. Crooker, Edward C. Leach.

Chicago, Ill.—United Taxicab Co., under Illinois laws, with \$10,000 capital; to do general automobile and garage business. Corporators—James A. Daniher, Patience Swanton, Edward G. Woods.

Weehawken, N. J.—Hamilton Auto Co., under New Jersey laws, with \$6,000 capital; to manufacture and deal in automobiles and parts. Corporators—Hans C. Schultze, William Ihmken, Herman Mutz.

National Lubricating Axle Co., under New York laws, with \$15,000 capital; to manufacture and deal in machinery and tools. Corporators—Thomas C. Stokes, Jr., William M. Cornduff, and others.

Newburgh, N. Y.—Mogul Auto Co., under New York laws, with \$100,000 capital; to manufacture and deal in automobiles and motor boats. Corporators—W. L. Waller, C. Monteith Gilpin, James M. Wright.

Manitowoc, Wis.—Ferromatic Tire Mfg. Co., under Wisconsin laws, with \$11,500 capital; to manufacture and sell automobile

tires and parts. Corporators—Chas. F. Wren, Conrad Werra, Theresa Wren.

Chicago, Ill.—Farrington Automobile Co., under Illinois laws, with \$10,000 capital; to manufacture and deal in automobiles and accessories. Corporators—Joseph T. Delfosse, W. H. Farrington, Samuel F. Scott.

East Orange, N. J.—Consolidated Taxi Service Co., under New Jersey laws, with \$300,000 capital; to conduct automobile livery business. Corporators—T. Faber, P. B. Scarff, H. E. Von Pein, all of East Orange.

Springfield, Mass.—Automobile Lighting Co., under Massachusetts laws, with \$30,000 capital; to manufacture and deal in automobile apparatus. Corporators—H. W. Field, M. N. Ryan, C. P. Lyman, E. N. Frary.

Akron, Ohio—Alton Motor Accessory Co., under Ohio laws, with \$50,000 capital; to manufacture and deal in accessories. Corporators—E. W. Brouse, H. Williams, C. H. Maranville, A. F. Maranville, C. S. Pelton.

New York City, N. Y.—Schwab-Chubb Tire Protector Co., under New York laws, with \$50,000 capital; to manufacture and sell tire protectors for automobiles, etc. Corporators—A. Schwab, F. T. Barry, N. Schwab.

Elmira, N. Y.—Elmira Taxicab Co., under New York laws, with \$1,500 capital; to acquire, own, operate and rent automobiles, motorcycles, etc. Corporators—H. H. Roberts, Gordon H. Roberts, Mortimer L. Sullivan.

New York City, N. Y.—Carhartt Automobile Sales Agency, under New York laws, with \$50,000 capital; to deal in automobiles and motor vehicles of all kinds. Corporators—L. Earle, F. Hoar, H. W. Richardson.

Brooklyn, N. Y.—Palmer-Herring Motor Co., under New York laws, with \$20,000 capital; to manufacture automobile engines, motors, motor boats and vehicles. Corporators—H. W. Palmer, C. N. Herring, F. P. Twyford.

New York City, N. Y.—Livingstone Radiator & Mfg. Co., under New York laws, with \$150,000 capital; to manufacture radiators and other heating and condensing apparatus. Corporators—W. S. Lare, C. A. Bruce, T. Roberts, Jr.

New York City, N. Y.—Harper Engineering Co., under New York laws, with \$50,000 capital; to manufacture and deal in engines, automobiles, motor boats, etc. Corporators—E. F. Berkeley, Wm. Harper, Jr., A. J. Clayton and others.

New York City, N. Y.—Balance Gear Light Vehicle Co., under New York laws, with \$30,000 capital; to manufacture vehicles, motors, engines of all kinds. Corporators—Walter E. McDonnell, Thomas Spalding, Michael J. McDonnell.

Detroit, Mich.—Stanley Power Wagon

Co., under Michigan laws, with \$10,000 capital; to manufacture and deal in automobiles and accessories. Corporators—John C. Shaw, H. A. Douglas, F. R. Hathaway, G. G. Scranton, Jos. G. Hamblen.

New York City, N. Y.—Hercules Suspension Co., under New York laws, with \$50,000 capital; to manufacture and deal in wheels and accessories to automobiles, bicycles, etc. Corporators—Geo. E. Armstrong, Luther G. Pillings, Darius E. Peck.

Union, N. J.—Guttenberg Motordrome Association, under New Jersey laws, with \$100,000 capital; amusement and racing enterprises. Corporators—C. Dietz, W. Ihnken, N. Bergen, F. Wahlers, H. Shaffer, F. Gathman, P. Seglie, W. Renner, R. Specker.

New York City, N. Y.—Dunlop-Taylor Motor Co., under New York laws, with \$5,000 capital; to manufacture and deal in automobiles and accessories. Corporators—C. M. Dunlop, M. L. Dunlop, A. E. Dunlop, B. C. Taylor, all of 1876 Broadway, New York City, N. Y.

New York City, N. Y.—The Motor Car Fixture Co., under New York laws, with \$10,000 capital; to manufacture automobiles, motor boats and accessories. Corporators—John H. Dale, Walter I. Hess, Christian P. Roen, all of Ninth avenue and 13th street New York City.

New York City, N. Y.—New York Rotary Engineering and Accessories Mfg. Co., under New York laws with \$50,000 capital; to manufacture motors, engines, taximeters, etc. Corporators—David Davis, Harry Katz, Chas. M. Lackland, Jr., of 299 Broadway, New York City, N. Y.

Knoxville, Tenn.—East Tennessee Motor Co., under Tennessee laws, with \$10,000 capital; to manufacture and sell automobiles, gasoline engines, motorcycles, trucks, accessories, and iron fences, and do a general garage business. Corporators—A. P. Rutherford, D. H. Jenkins, W. H. Bowman, A. A. Schmid, E. P. Rutherford.

**Detroit Branch for Hartford Parts.**

The Hartford Auto Parts Co. of Hartford, Conn., has opened a branch office in Detroit, Mich., in order to be closely in touch with the western trade in the supplying of cone clutches, universal joints and other parts. F. L. Martin, secretary and sales manager of the company, will be in charge of the Detroit office for the next two or three months, with temporary headquarters at the Hotel Pontchartrain.

**Lasher Resigns From Koehler.**

W. J. Lasher, general sales manager of the H. J. Koehler Co., the New York City agents for Hupp and Everitt, has resigned and will leave the company on July 1. He will take a vacation of several weeks in the Maine woods before again engaging actively in the trade.

**INFRINGEMENT MAY SAVE PATENTS**

**Such Manufacture in Great Britain Helps Prevent Revocation of Patentee's Rights—Mercedes Group Involved.**

An unusual turn has been given to Great Britain's patent act of 1907 permitting the revocation of patents which are not adequately "worked" in Great Britain, by the discovery that even where the patentee has failed to work his patent to a sufficient extent to prevent its revocation, the patent still may be maintained in its full vigor if infringers have worked the invention in Great Britain during the period. In short, the infringers sometimes may be a blessing in disguise, in keeping the patent alive, where otherwise it would be revoked under the law.

This point developed in the effort of Fiat Motors, Ltd., of London, for a revocation of the group known as the Mercedes patents, belonging to the Mercedes-Daimler Motor Co., Ltd., and relating to live rear axles, the so-called "gate change" or selective grid segment for the change gear, honeycomb radiators, water-cooled brakes and flywheel fans. It was shown that although there might be doubts as to whether manufacture under these patents had been conducted in Great Britain by the patentees to an extent that would prevent revocation, there was an extensive manufacture by British infringers, which if taken into account would constitute an ample "working" of the patents.

Both sides agreed in asking for a decision on the admissibility of this evidence on behalf of the patentees, and that in the meantime no further evidence should be taken or discussed. The question, as presented to the comptroller-general of the Patent Office, was whether in comparing the manufacture at home and abroad the amount of manufacture by infringers in Great Britain can be taken into consideration, or whether the only manufacture on which the patentee may rely is manufacture by him or his licensees.

In making his finding for the patentee, the comptroller-general, W. Temple Franks, says:

"The question which I have to decide appears to me to be concluded at present by authority, and I decide that manufacture by infringers in this country must be taken into account if in favor of the patentee. The consequence of this is that upon the admission of the applicant for the purposes of this decision, the patentee is entitled to a finding in his favor, at any rate upon two of the patents."

**Court Dismisses 21 "Licensed" Defendants.**

Motion to dismiss the case of the Velie Motor Car Co., of Moline, Ill., for \$500,000

damages against members of the Association of Licensed Automobile Manufacturers, has resulted in 21 of the 25 companies being dismissed as defendants, although Judge Turner, of the circuit court for Milwaukee county, sitting at Milwaukee, Wis., holds the remaining four companies as subject to the Velie complaint. These include the Chalmers Motor Co., the Pope Mfg. Co., the Locomobile Co. of America, and the Pierce-Arrow Motor Car Co., whose contracts with their Milwaukee agents, respectively, are of a nature to make the court think that the agents are legally the representatives of the manufacturers, and that service and summons on the Milwaukee agents in their cases is binding on the companies. The twenty-sixth defendant, the Kopmeier Motor Car Co., of Milwaukee, an agent, was not subject to the motion, as it is a resident defendant.

**Goodridge to Travel for Matheson.**

T. W. Goodridge, who in his past connections with the Electric Vehicle Co., the Studebaker Automobile Co. and the Maxim-Goodridge Co., became prominently identified with the trade, has joined the forces of the Matheson Automobile Co., of New York. His first duties will be in establishing agencies for Matheson cars from Pittsburgh to the Pacific Coast. The company also has acquired F. J. Manning, formerly with the Warner Instrument Co., as a salesman in the New York district.

**Enormous Plant for Hewitt in Detroit.**

The Hewitt Truck Co., which is owned by the Metzger Motor Car Co., of Detroit, Mich., is to have a large factory of its own on a 40-acre site in the northwest section of the city, in the vicinity of Hamilton boulevard and the Detroit Terminal railroad's outer belt. The first building is to be 1,200 feet in length, and so arranged that additions may be attached conveniently. The plant will make trucks of from three to ten tons capacity.

**Latta Becomes Maxwell Secretary.**

Lloyd E. Latta, who some six weeks ago became connected with the Maxwell-Briscoe Motor Co. in the capacity of assistant secretary, has been elected secretary of the company. For the past four years he has been assistant manager of the Racine Mfg. Co., of Racine, Wis., a body building concern, previous to which he was secretary of the Union Terminal Construction Co., of New York City.

**Grant-Lees Opens Office in Detroit.**

The Grant-Lees Machine Co., of Cleveland, O., making helical timing gears, transmissions, steering gears and differentials, has opened a branch sales office in Detroit, Mich., at 1001 Ford building. Ernest L. Smith, sales manager of the company, will exercise immediate supervision over the Detroit office.

**PRAISES THAT FAILED TO PLEASE**

**"United States Trade Reports" Bungles Badly in Lauding a Jamesville Product—Tried a Venerable Game.**

That venerable bunco game known as the "United States Trade Reports" has bobbed up again in the automobile field, looking for "suckers," and in the effort it has been guilty of so ludicrous a mistake that nothing could more clearly point out the "rawness" of its methods. Selecting the Jamesville Mfg. Co., of Jamesville, Wis., as a possible victim, the alleged editorial department of the United States Trade Reports, of Cincinnati, O., on the 10th of this month forwarded a sickeningly laudatory article of about 500 words, concerning the Jamesville company's "auto wheels" and giving them "our editorial commendation." As usual, the letter accompanying the article suggested that the company modify or add to the article in any way that it might see fit, and also that it order a generous number of copies of the issue of the Trade Reports in which the article would appear, these copies being 15 cents each in small lots, down to 8 cents per copy in 1,000 lots. As a matter of fact, the Jamesville company gave up the manufacture of automobile wheels so long ago that it has forgotten all about them, and is confining itself to automobile and machine parts, motor car fittings and control levers. "What makes us particularly mad," says the secretary of the company, "is that they should assume that we would be easy enough to fall for their scheme."

The offer of the "Trade Reports" of free "write-ups" without charge has been a bait which in the past has tempted several manufacturers to "bite." The gist of the proposition is expressed in that portion of the "editor's" letter, which reads as follows:

"As this is an editorial, of course there is no charge for publication and in addition if you can use any extra copies of the issue in which it will appear, we will be pleased to make you the following special reduced rates, as we are desirous that you should get as much benefit out of it as possible. Although the publication does not depend on an order for copies, such an order will be appreciated by us."

With prices ranging from \$12 for 100 copies to \$80 for 1,000 copies of the flimsy and meager sheet in which the "Trade Reports" occasionally is printed, the "sucker" pays well for his words of unstinted praise and "editorial commendation." Furthermore, despite the assertion that "publication does not depend on an order for copies," the manufacturers who failed to order in no instance were given subsequent reason to believe that the articles ever appeared.

# WHITE GASOLINE CARS

## for 1911

**SIZE AND POWER**—moderate, therefore, most economical to maintain.

**PRICE**—moderate, therefore, easy to buy.

**DESIGN**—includes many advanced features not found in any other American car.

**QUALITY**—The only moderate sized car wherein every part is just as well built as in the highest-price, high-powered cars.

**DELIVERY**—Very few open dates. First come, first served.

#### Danger in High-Sided Bodies.

Attended by more or less of the absurdity which usually accompanies the evolution of a new style, the high-sided or front-door type of body rapidly is winning its way into prominence. As evidenced in the less conspicuous forms, which closely resemble the conventional touring or small tonneau body with front doors added, its utilitarian aspect rapidly should earn for it considerable popularity, while the true torpedo form is calculated to appeal to exactly the same class of motorists which a year or two ago took up the racy-looking roadster type. One tendency which marks the advent of a large proportion of the bodies of this general class, however, is distinctly objectionable. That is the unhandy arrangement of the mechanism of control.

Without in the least deprecating the advisability of retaining a uniform style of chassis for all models, it is plainly evident

that this practice results in many cases in a most crude placing of the control levers outside the body. Hence, in order to manipulate the change gears and emergency brake it is necessary for the operator to lean over the high "gunwales" of the car, and, in some instances, to perform most marvelous contortions in order to grasp the levers. Obviously such an arrangement is not conducive to good driving, while at times it may place the safety of the car and its occupants in jeopardy. It is neither safe nor sane to produce a car in which the driver's movements in any way are hampered or in which they combine to tax his mental or muscular powers.

To overcome the difficulty it is necessary either to sacrifice the uniformity of the chassis of the vehicle and to bring the levers inside the frame line, or else to alter the form of the body in such a way as to permit it to include them. In occasional instances, both these arrangements are found in torpedo and inside driven coupe and limousine body forms. When combined with suitable treatment of the paneling, the result is in no sense objectionable to the eye, while it adds a great deal to the operating convenience of the machine. Apparently there is no practical reason why the levers of all torpedo and high-sided bodies should not be brought inside save that such an arrangement does not suit the body designer's ideas of contour. But that it may be worth while to sacrifice purely ethical objections in view of a useful object goes without saying.

#### Elimination of the Chassis.

It is inevitable that present ideas governing motor vehicle construction should undergo considerable alteration in the course of time. Nor is it irrational to conclude that some of the new ideas entertained may be radically opposed to what at present are considered the basic tenets of automobile design. One way in which a change may be brought about is in the elimination of the chassis, as such, in order to secure better interchangeability of parts and more thorough subserviency to structural principles. Radical as this conclusion may appear, there is much to base it upon, despite the fact that it apparently argues a reversion to type.

A couple of years ago there was exhibited at one of the shows a touring car which was remarkable in that it was frameless,

the function of the ordinary frame being fulfilled by the body itself, which was of pressed steel, suitably shaped for strength, and autogenously welded into a single piece. The body and frame thus being formed as a single and substantial unit, the attachment of the axle units and the power and transmission units became a relatively simple matter.

In French practice, very recently, a somewhat similar scheme has been adopted in connection with the use of a peculiar and radical form of power plant which forms a unit with the torsion member. As worked out for light vehicle purposes, especially with regard to the demands of the small public service cab, this system develops an astonishingly light and simple vehicle, samples of which at present are in use in New York City.

A third and even more striking example of the frameless principle, is that of the new Daimler omnibus, which just has been brought out in England. In this vehicle, not only is the frame developed in the body structure, but the basic idea has been carried out in a very thorough manner. Either of the two power and transmission units may be dismounted without disturbing the body in any way and with only local disarrangement of parts; each unit is entirely independent of the other; the body-frame-work structure is economically designed, as is evidenced in the use of the walls of the fuel tank for purposes of reinforcement against weaving; and the net result is that the machine is shorter, has a wider steering lock and handles better in every way than the conventional type of vehicle which it is designed to replace.

The chassis, it will be remembered, was fixed upon as a suitable form of construction at a time when builders were suffering the results of inadvisedly mounting parts subject to heavy stresses upon lightly built wooden bodies and frames. It also was favored because of the facility which it offers for divorcing the construction of the running gear and coachwork, thus permitting interchangeability of bodies and also affording the buyer limitless option in the choice of the externals of the machine. These arguments always will hold true with respect to machines in which the interchangeable body feature is a desideratum. For cars built for the big-volume, low-cost market, and for commercial vehicles, however, it is by no means unreasonable to pre-

dict that the chassisless style of construction will be employed quite extensively in the future. It has many features to recommend it, by no means least of which is the combined advantage of ample strength with low manufacturing cost.

#### Wherein Many Tops are Unsatisfactory.

Whatever may be said in favor of the workmanship and material which go into the average automobile top, many motorists find to their discomfiture, when overtaken on the road by a storm, that the side curtains do not fit properly, or, if yielding to persuasion, are inclined to come adrift persistently and maliciously. Whether it be that the snap fastenings are insecure or that the tops are not properly fitted in the beginning, or whether the result arises through straining of the bows and consequent warping of the light top structure, the fact remains that the curtains do not "stay put" and properly fulfill their emergency service in many instances. The spectacle of a large number of machines flying for cover in a heavy shower, with curtains flapping wide and occupants drenched or holding the curtains, by no means is a convincing argument of the success of the average top covering. That the average owner does not discover the difficulty until a time when he sorely is in need of adequate protection from pouring rain or hail, only adds to the unpleasantness of the situation.

#### To Prevent Accidents to New Owners.

Dealers delivering cars to new customers have reason to put special emphasis on the warning against cranking the motor before making sure that the gear change is in the neutral position, as the usual spring crop of garage accidents, with private owners crushed between the car and the wall, is being harvested. It is not enough that the operator of the car be careful always to have the gears in neutral position when leaving the machine. The gears may be moved into engagement by some outsider while the car is standing. This possibility makes it imperative for safety's sake that the change gear lever be examined and the gears surely out of engagement before the engine is cranked. By pointing out the danger and urging customers to exercise particular precaution in this regard, dealers may avert a great proportion of the too numerous mishaps that otherwise may occur.

## COMING EVENTS

June 14-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 22-25, Minneapolis, Minn.—Automobile races at state fair grounds.

June 25, Port Jefferson, N. Y.—Automobile Club of Port Jefferson's hillclimb on East Broadway hill.

June 25, Yonkers, N. Y.—Mount Vernon Automobile Club's race meet at Empire City track.

June 28-30, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' Association's endurance run for "Star" trophy.

June 30, Winnipeg, Man.—Winnipeg Automobile Club's annual tour; 455 miles.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 2-4, New York City—Touring Club of America's sociability-guessability run to Waterbury, Conn., and return; 200 miles.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

July 4, Muskegon, Mich.—Gentlemen's Driving Club's automobile race meet at Driving Park.

July 4, St. Paul, Minn.—Minnesota State Automobile Association's race meet.

July 4, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

July 4, Auburn, N. Y.—Auburn Automobile Club's hill climb.

July 4, Dallas, Tex.—Dallas Automobile Club's race meet.

July 4, Denver, Col.—Denver Motor Club's 200 miles road race; postponed from May 30.

July 11, Plainfield, N. J.—Plainfield Automobile Club's annual hill climb.

July 12, Charleston, S. C.—Charleston Automobile Club's beach races at Isle of Palms.

July 13, Winnipeg, Man.—Winnipeg Automobile Club-Winnipeg Motor Trades Association joint racemeet.

July 15-16, Riverhead, L. I.—Motor Contest Association's second Long Island Stock Car Derby.

July 15-16, New York City.—Motor Racing Association's second 24 hours race at Brighton Beach track.

July 15-19, St. Paul, Minn.—Minnesota

State Automobile Association's second annual reliability tour for "Dispatch" trophy.

July 18-22, Milwaukee, Wis.—Wisconsin Automobile Association's first annual endurance test for "Milwaukee Sentinel" trophy.

July 30, Wildwood, N. J.—North Wildwood Automobile Club's race meet on Wildwood Speedway.

August 1, Minneapolis, Minn.—Minneapolis Automobile Club's reliability run.

August 3-5, Galveston, Tex.—Galveston Automobile Club's beach races.

August 6, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

August 12-13, Indianapolis, Ind.—First 24 hours race on Indianapolis Motor Speedway.

August 15, Algonquin, Ill.—Chicago Motor Club's annual twin hill climb.

August 15, Washington, D. C.—Start of second annual Frank A. Munsey reliability contest.

August 15-19—Start of second annual Munsey Historical Tour from Philadelphia, and terminating at Washington, D. C.; 1,700 miles.

August 17, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

August 26-27, Elgin, Ill.—Chicago Motor Club's road race and speed carnival.

August 31, Minneapolis, Minn.—Minnesota State Automobile Association's reliability run.

September 2, 3 and 5, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

September 5, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

September 7-10, Buffalo, N. Y.—Automobile Club of Buffalo's touring reliability contest; 800 miles.

September 9, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

September 10, San Francisco, Cal.—Automobile Club of California's road race in Golden Gate Park.

September 10, San Francisco, Cal.—Automobile Club of California's Portola road race in Golden Gate Park.

September 17, Syracuse, N. Y.—Automobile Club of Syracuse-Syracuse Automobile Dealers' Association joint racemeet at Fair Grounds track.

September 18, Los Angeles, Cal.—Annual road race up Mount Baldy.

October 1, Mineola, L. I.—Sixth annual Vanderbilt Cup race on Long Island Motor Parkway, under the auspices of the Motor Cups Holding Co.

# GLIDDEN TOUR A FEARFUL GRIND

Frightful Roads and Hellish Heat Cause it to Become an Elimination Contest—At End of Ninth Day Only 14 of 26 Starters Remain and but One, Wm. Bolger, Retains a Clean Score.

## THE DAILY SCORE AND THE STANDING AT CLOSE OF NINTH DAY FOR THE GLIDDEN TROPHY.

## Alabama Adds to the Agony, Relieved Somewhat by Hospitality of the Inhabitants

Sheffield, Ala., June 16.—“Alabama,” we are told, means “here we rest,” and the meaning had more than usual significance for the Gliddenites when the caravan arrived here at 5 o'clock this afternoon. They were ready to rest and needed a chance to lick their sores of yesterday and galls and blisters supplied by today's run.

The wise ones surmised there was a coon in the fence when the found they had a run of only 119 miles from Nashville, Tenn., and almost seven hours in which to do it. The exact running time was 6 hours 39 minutes. So they “beat it” awhile the beating was good, so to speak. This was early in the day. The start was made at 9 o'clock and the Nashville Automobile Club turned out with upwards of 200 cars and lined the road leading from the city to give the boys a good send off. From the city line to Columbia by way of Franklin, Brentwood, Springhill, and Appolis the road was almost ideal. There were seven toll gates, but the tourist gave up gladly in view of the heavy toll they paid in tires during the day before over tolless roads. It was on

this stretch that the wise ones hurried their cars to gain time for what was to come.

One of the contestants for the Chicago trophy was arbitrarily removed from the clean score list by the officials today—the Moline car No. 100. It was penalized 9 points for oiling parts of the running gear at the noon control at Columbia. W. H. Vandervoort, president of the Moline Motor Car Co., who is accompanying the Moline squad, was a passenger in car No. 102, has protested the penalization, saying that he used the oil can in the full belief that it was permitted under the rules, and other entrants share Mr. Vandervoort's interpretation of the rules. The technical committee stated it would discuss the matter, and if Mr. Vandervoort substantiated the facts the penalization might be removed later. Three other cars penalized during the day's run were the Pennsylvania No. 14, Parry No. 105, Cartercar No. 108, and Westcott No. 111. Cartercar No. 109 and Cole car No. 104 had not arrived up to 10 o'clock. These two came in from the preceding day's run at 4 o'clock this morning. The Pennsyl-

vania was fined 7 points for late arrival, the Parry 5 points for work on the muffler and 32 points for late arrival at the night control. The Cartercar was penalized 2 points for work on the clutch, and the Westcott was penalized 7 points for work upon the seat of the motor.

It was a two hours 18 miles schedule to Columbia, but most of the drivers got in with a half-hour to spare, but they had ample opportunity to see the ideal Southland—the stately homes of “first families” situated back from the highway on blue grass lawns and shaded with noble oaks and birches. Here, too, were the cabins of the negroes for contrast, and it was observed that the farther south the Gliddenites go the darker grow the darkies. It was a country of fine plantations with the wheat newly harvested and standing in shocks on the fields. In the phosphate mining district between Mt. Pleasant and Sandy Hook there was a genuine black belt. White faces were seen but seldom at Mt. Pleasant, and at Rockdale Furnace the whistles in the phosphate mills blew while the cars

FOUR VARIED EXAMPLES OF SOUTHERN "HIGHWAYS" TRAVELED BY GLIDDEN SUFFERERS

were passing and the darkies shouted in high glee at the parade.

From Rockdale Furnace the going grew worse. It was up hill and down dale mile after mile. The road led through a second growth of timber a large part of the way. The cars had to go through streams where the water was up to the running boards at times. Buffalo Creek, near Summertown, was one of the deepest propositions. The drivers were obliged to perch the mechanics on the bonnets of the cars to hold the mud aprons so as to prevent the radiators from being flooded. At Lawrenceburg, 76 miles from Nashville, the cars were obliged to negotiate a dry water course—a steep down grade strewn with rocks, stumps and ruts. The strain on the brakes was terrific and

derful stability. The people along the route acted as if they had never seen such a wonderful sight before. This was principally the case in the "poor white" section. Before every cabin were the families with relatives and visitors from remote sections gazing wide-eyed at the strange show. The special treat in their eyes was probably the fact that the faces of the Gliddenites were painted like the features of an Indian with his war vermilion on from the dust arising from the red clay that formed the earth roads of lower Tennessee and Alabama. At Florence, Ala., the inhabitants met the tourists at the foot of the hill with bottles of Coca Cola. Another delegation presented cigars, a third delegation of young ladies farther on pre-

cession, and the ladies aid society supplemented the revenue therefrom by peddling cigars among the tourists. The prominent citizens did their part to welcome the visitors. They escorted fortunate ones to an upper room and gave them drinks which are banned in this "no license" community.

That there were no more penalizations was considered almost a miracle in view of the heavy trial to which the cars were put in many parts of today's run. The test was as hard as that of yesterday in some particulars, and might well have brought out weak points resulting from yesterday's hard usage. Tomorrow's running scheduled to the noon control, Corinth, Miss., will be 3 hours 27 minutes, and 8 hours 59 minutes to Memphis. The touring car schedule

VAN DERVOORT'S MOLINE ON A MISSISSIPPI HIGHWAY

GREAT WESTERN PRESS CAR AGAIN TAKES TO WATER

a slip meant destruction for the cars and the Lord knows what for the occupants. A correspondingly stiff hill was encountered approaching Green Hill, Ala., and a worse one was encountered in timber near St. Florian.

Altogether the roads were bad most of the way from Rockdale Furnace to the threshold of Sheffield. That the cars came through with so comparatively few penalizations was due in the main to their won-

derful stability. The people along the route acted as if they had never seen such a wonderful sight before. This was principally the case in the "poor white" section.

At Nashville the official hotel was stormed by a convention of yelling, fire-eating southern politicians. At this place the Gliddenites found themselves stowed away in the hotel with as many as 15 cots in a ward and one sheet for modesty's sake. The supper was served by the ladies aid society of the Methodist Church of this place. The hotel sold the society this con-

is 8 hours 5 minutes. In view of the reports of muddy going the start for Memphis will be made at 6 o'clock with two pilot cars starting out at 5 o'clock.

The press representatives held another indignation meeting this evening to protest against laxness and inefficiency of those in charge of fixing the penalizations for the cars daily. It has been impossible to get any scores until late, and at times none have been given out at all.

## Villianous Roads Lead to Threats of Tar and Feathers

Memphis, June 17.—There is an explosion pending among the entrants in the Glidden Tour, and the date of the touch-off depends upon the road conditions and schedule of the tour in the immediate future. If the conditions are as vile and intolerable tomorrow as they have been today and yesterday and the day before, there will be fireworks to morrow night. Otherwise it may be deferred a day or two, but in any event the drivers and those having charge of the cars entered for the Glidden

and Chicago trophies on this tour have been getting madder and madder, and hotter and hotter, until affairs have arrived at a state of spontaneous combustion where the flame is liable to burst out at any moment.

The seeming limit of exasperation was reached today, when the officials in charge of the tour set the same schedule of 20 and 18 miles an hour for the Glidden and Chicago trophy contestants that they set on the first day, when the going was easy, and on the second day when it was worse,

and on the third when it was "worse." And today the going was worst of all. Veterans of former Glidden tours, some having been on all of them, declare positively that not at any time in the past six years has there been encountered so much of difficulty and danger packed into a single day's run as was crowded in today's journey from Sheffield, Ala., to Memphis, Tenn., 167 miles. Every obstacle, impediment, obstruction, difficulty and danger that could be imagined were encountered.

The officials had full knowledge of this combination of car-smashing conditions, yet they abated not one jot nor tittle from the pace they set for the first day's run from Cincinnati, which now appears by contrast to have been nothing more than a joy ride on Riverside Drive or on Jackson Park boulevard. The officials knew the conditions, for they alone had a complete report from Pathfinder Dai H. Lewis. Therefore the entrants feel that the officials are either grossly incompetent or have conspired against the entrants and their cars. So positive is the feeling that their indignation reached a point today where they talked of tar and feathers for some of the officials whom they considered parties to the alleged conspiracy.

The proof of the pudding is in the eating, say the exasperated entrants, who point to today's list of casualties and penalizations as absolute proof that the schedule was too stiff for the terrible road conditions. Among the counts of the indictments against the officials are these facts:

That Pennsylvania car No. 14 was burned and consequently has been withdrawn from the contest.

That one of the Cadillac "gunboats," manned by the soldier cadets of the Northwestern Military Academy, lies wrecked in the Alabama swamps with a broken axle.

G have failed to come in tonight in time to be reported.

And that only two cars of the original 26 contestants have survived with perfect scores the first four days' run.

The contestants say that if the officials wanted to put themselves in a position to

the rough woods that constituted the larger part of to-day's going. All of the cars had to do a dance over the same sort of chevreaux de friture, but the Pennsylvania was the one that was fated to be the goat.

The Cadillac "gunboat" broke its axle while faithfully trying to follow the con-

BALLINGER'S PREMIER "LICKING UP" ONE OF THE MANY FORDS

ONE OF THE PRESS CARS STALLED IN MIDSTREAM

That the companion "gunboat" was sunk in a bog covered by the confetti trail, and was rescued only by the application of jack screws.

That the Chalmers pilot car lies out in the Tennessee wilds, a wreck, with its differential shot to pieces.

That Lexington car No. 110 is out somewhere with its steering gear stripped.

That the Parry 40, the Cole 30, Parry 35, Cartercar Model C and Cartercar Model

say that only one car ever survived the Glidden contest with a perfect technical score, they could not have gone to work differently.

For details of today's record of disasters, due to worse than incapacity, the entrants submit the following facts, supplementary to the foregoing record:

The Pennsylvania was burned by the wrenching off of its exhaust pipe by one of the thousands of stumps that strewed

fetti trail and keep up with the procession. The accident that hammered off its good rear axle might have happened to all of the rest but for a higher Providence than the officials of the contest committee of the A. A. A., which compelled the contestants to go over the most execrable roads in America at a rate of 18 and 20 miles an hour.

The Chalmers pilot car was wrecked within 58 miles of this place, amid roads so incredibly vile as to be almost impossible. It had striven nobly for four days to strew the confetti and keep ahead of the contestants, but after four days of schedule-making by the officials the car broke down prematurely this afternoon.

Car No. 2, a Premier, was penalized 121 points for repairs to ignition and late arrival in control.

Car No. 3, a Chalmers, was penalized for two hours' delay in arrival in control and work on its steering column.

Car No. 4, a Chalmers, was penalized 89 points for a broken muffler and bent brake rod.

Car No. 6, a Cole, was penalized 134 points for adjusting brakes.

Car No. 10, a Glide, was penalized 65 points for repairing a loose hood, loose fuel pipe, and filling the radiator twice.

Car No. 15, a Cino, was penalized 54 points for late arrival.

Car No. 100, a Moline, was penalized 3 points for late arrival. Cars No. 101 and 102, Molines, were penalized 50 and 39 points, respectively, the former for late ar-

rival and filling the radiator, and the latter for late arrival.

Car No. 103, a Lexington, was penalized 224 points for late arrival and tightening the steering gear.

Falear No. 106, Maxwell No. 107, and Westcott No. 111 were penalized 83, 23

ing roots. The same kind of wood roads began at the outskirts of Iuka, and grew worse instead of better. It was near Iuka that the first Cadillac "gunboat" broke its axle, and then came a swamp where the cars slithered and wallowed from bog to bog, and within three miles of the first

caped only by the mightiest struggles, their axles being afloat in the mud. They were wrenched and twisted by the prodigious efforts required to extricate them.

And this was not all. There was a few miles of good going into Corinth, but this quickly gave way again to the roughest kind of southern wood roads. The road between the tracks many times scraped the pans and gear cases, and to add to the difficulty, there were stubs and stumps at the apex of the inverted V's and U's that menaced the machinery. At other times, the cars were tilted upon a front right and a rear left wheel, and again the front left and rear right, and sometimes ran on three wheels in the washed out cart paths. Again, there were good roads corduroyed with planks and trestles over swamps, and at other times there were roads and bridges so narrow, with steep falls at the side, so as to place the lives of the occupants of the cars in danger hundreds of times, and they were saved from disaster only by the skill and nerve of the drivers. The route led among the homes of the poor whites of Alabama and Tennessee, and at long intervals there was not even a log cabin in sight. The whiskered men and bedraggled women with anywhere from five to nine children around them looked upon the automobiles as ordinary people regard flying

ONE OF THE PRESS CARS HELPS MATSON OUT OF A HOLE

and 142 points, respectively, for late arrival.

Tomorrow the tourists go from this point to Little Rock, Ark., 207 miles, on a schedule of 11 hours 32 minutes for the 18-mile cars, and 10 hours 23 minutes for the 20-mile cars. The cars have the option of stopping at Clarendon, 112 miles, but must be checked there. The time allowance is 6 hours 14 minutes for the 18-mile class and 5 hours 37 minutes for the 20-mile class.

The run today led for the first 20 miles, from Sheffield to Cherokee, over fairly good roads, and here the contestants hurried for all they were worth, to go as far as they could in as short a time as possible. Then they plunged into hilly country where the going roughened and where negro women worked in the cotton fields. The cultivated fields yielded to scrub pines and live oak, and the roughest kind of woodland roads. From Cherokee to Iuka it was a struggle with roads shaped like S's, U's and V's, and these inverted and all kinds of combinations of both. They were torn by winter torrents which sunk the wheel tracks among the stones and stumps and protrud-

UNMIRING THE OFFICIAL COLUMBIA NEAR LAWRENCEBURG, TENN.

Cadillac the second one was mired. Other cars were mired, too; the remainder es-

machines, and the automobiles were just as far out of their reach.

## More Swamps and Treacherous Going; Midnight Arrival at Little Rock

Little Rock, Ark., June 18.—"The Night Riders," so the participants in the first annual elimination contest of the American Automobile Association—heretofore known as the Glidden touring contest—called themselves during today's run of 207 miles from

Memphis to Little Rock. The appropriateness of the designation was obvious in view of the arrival here of the cars and contestants between 11 and 1 o'clock.

The elimination scheme of the Contest Board worked perfectly today. Two more

competing cars were knocked down and out—the Cartcar No. 109 with a broken steering knuckle and Cole No. 104, which broke an axle. Both have withdrawn from the contest. The Cartcar No. 109 broke its steering knuckle near Burnsville, Miss.,

after being mired and nearly killing the driver of a mule team who was hauling it out by knocking him down and ramming him into the Mississippi ooze. Cartercar No. 108 also suffered, sustaining a broken spring. In addition, Ohio No. 11 was penalized 117 points for soldering the radiator twice, and taking oil and gasoline out of control.

The accidents to the Cole and Cartercars were due entirely to the pounding they received in the three days' ordeal over the frightful roads from Louisville to Memphis at the schedule of 20 and 18 miles an hour for touring cars and runabouts, respectively. The road conditions today were not of a nature to work injury to either engines or running gear, but the cars which had been weakened in the three preceding days' runs fall easy victims to any shock today.

The first car was checked out at 6 o'clock this morning, and all were off by 6:30. The route closely followed the left bank of the Mississippi River, generally running close to the levees. It led through the towns and villages of Lynchburg, Walls, Lake Cormorant, Robinsonville, Tunica, and other places where white people appeared as scarce as white blackbirds and niggers were almost the only ones to be seen. The Gliddenites arrived at Trotter's Landing, where a huge flatboat awaited them. The cars were run aboard. Some thoughtful members of the Helena (Ark.) Automobile Club, had provided the ferriage, and also sandwiches and bottles of beer in tubs of ice on the forward part of the scow. This was esteemed a considerable treat, inasmuch as the majority of the tourists had

not had a drink of anything stronger than water since the start this morning. The schedule to the ferry for runabouts was six hours 14 minutes, and for the entire run 11 hours 32 minutes, and the touring cars 5 hours 37 minutes to the ferry and 10 hours 33 minutes to Little Rock.

But it was 2 hours and 58 minutes from the time that they were loaded onto other barges at Clarendon and unloaded at Roe on the White River, eight miles below. As a result it was 5:54 o'clock before the cars were ready to start from Roe with 87 miles before them to Little Rock.

The welcome of Arkansas to the Gliddenites was in the form of a brisk shower that cooled the atmosphere and settled the dust. The temperature through Mississippi was about 98 degrees in the shade, and from Helena to Clarendon was very near 100 degrees. It was the hottest weather the tourists encountered since the well remembered run from Oakley to Salina, Kan., last year. The shower, however, overdid the matter of settling the dust somewhat, for it turned the dust into slippery clay, which necessitated the use of tire chains. The envied members of the party were those occupying the Moline cars. These carried canopies, which kept off the sun from the occupants of the driver's seat and the tonneau, making them cool and comfortable, while the occupants of the other cars were broiling under the southern sun.

Daylight faded before the tourists were far on their way from the landing at Roe. There were several bad stretches of swamp to cross, with incidental danger of skidding, but for the most part the going was con-

sidered remarkably good, in contrast with that of the three preceding days. The beauty of the Arkansas landscapes is a surprise to the majority of the Gliddenites. Their expectations were the grotesquely caricatured Arkansas of the funny papers, with rough log cabins and uncouthly whiskered natives, whereas the reality was the finest farming country they had seen in five days' travel and hospitable and well to do inhabitants. From Stuttgart to Carlisle the country was as level and as green as a billiard table and divided into thrifty farms. Acre after acre of rice fields were seen with steam pump plants for flooding the rice in the evening. The effect when the moon came up and shone on the water between the rice rows was very pleasing. The inhabitants of all the villages turned out in a body and welcomed the tourists with great enthusiasm up to the time the last car passed through, at 11 o'clock.

On this side of Lonoke the most difficult test of the whole day's run occurred. This was in the form of about two miles of swamp. The road through the swamp was a very narrow causeway rutted from travel in recent wet weather and slimy in spots from recent rains. The cars had to be driven very carefully in order to avoid skidding into the oozy depths that yawned on either side. The result of any momentary slip was illustrated by the fate of a Chalmers car that was passed in the middle of the swamp. It had gone too near the edge to turn out for some other vehicle and had skidded into the swamp. Only the lamps were able to be rescued at the time being; the rest of the car was saved later.

## Sunday a Short Day with Some Good Roads and but One Victim

Hot Springs, June 19.

Ten little engines standing on a line,  
One broke an axle, then there were nine.  
Nine little engines hitting up a gait,  
One smashed a fine spring, then there were eight.  
Eight little engines, good enough for Heaven,  
One cracked its strong frame, then there were seven.

To this merry ditty the first annual Grand Elimination Contest of the American Automobile Association is speeding merrily to the inevitable finish. Today, in the short run of 53 miles from Little Rock, Cartercar No. 108, which broke a spring yesterday, broke an axle to-day, and is out to stay. And Lexington No. 105 broke the right side of its frame. Both disasters are attributed to the pounding the cars received on the runs over the Louisville-Nashville pike and in the wood road trails and swamps of Mississippi. This leaves only 10 contestants for the Glidden and 6 for the Chicago Trophy—but 16 of 26 that started.

"But some of the cars came through all right," defensively maintain the representatives of the three A's. True, but that doesn't comfort the drivers and makers of

wrecked cars who were inveigled into a blind contest and obliged to go over indescribably bad roads at a speed of 20 miles an hour, so that those in charge of the contest might get to their suppers before dark.

Some of the officials on the tour have given up trying to defend the elimination methods. They admit now that the whole contest has been a farce, if not a crime, and claim that they have been unable to do differently. They say that the officials on the tour are suffering for the mistakes of those who planned and laid out the tour. But they claim that all they can do is to carry out orders.

Besides the misfortunes of the Cartercar and Lexington, other cars suffered penalizations. Cartercar No. 8 was penalized 28 points for tightening a drive chain and spring clips; Ohio No. 11 was penalized 18 points for filling a leaky radiator out of control; Cino No. 15 was penalized 10 points for tightening wheel bolts. Cole roadster No. 104 withdrew and continues as a non-contestant.

There is a very wise look in the eyes of the remaining contestants. The look has

been growing daily. It tells of a dawning comprehension of things not understood before. For instance, it tells of clearer knowledge as to why some of the larger manufacturers kept out of the contest for the Glidden Trophy this year. Outspoken entrants say that prominent manufacturers who were understood to be getting ready to make entries, backed down shortly after the return of the pathfinder. They believe that faithful friends who were on the inside with the Contest Board tipped these manufacturers as to the real rottenness of the roads, and advised them to keep out. Even Charles J. Glidden, who has toured all over the world and taken part in every Glidden Tour, kept out this year for the first time, and the wise Gliddenites believe sincerely that the reason he stayed away was because he declined to risk his neck racing over the barbarous and dangerous roads of Kentucky, Tennessee and Mississippi at 20 miles an hour.

"But wisdom comes in after years,

When we are old and gray,"

muse the drivers and owners of the wrecked cars. All of them declare they would never have entered the contest had they known

the frightful condition of the roads.

Little Rock sent the Gliddenites away at 9:30 o'clock this morning with a gentle shower that laid the dust and gladdened them with the smell of rain. The road out of the city was a wonderful piece of macadam, and the reason was apparent when the tourists passed a gang of 70 convicts who are employed by the state on road construction. The convicts were not working today, it being Sunday, and their camp was nowhere in sight, so the reason why they were lined up beside the road under guard of men with rifles was not obvious, unless it was that the state wanted to afford an exhibition of its good roads plant. The convicts were all negroes, dressed in gray

striped pants and shirts like human zebras.

The greater part of the run was over plain dirt roads. Some were very good, and some, especially in the hilly country approaching Hot Springs, were rough and rubbly, but nothing to complain of. Many of the cars had narrow escapes from penalization for not arriving in time.

In view of the complaints of the entrants, the officials of the Tour finally backed down from their rule of 20 and 18 miles an hour schedule in the case of tomorrow's run to Texarkana. As the contestants observed, when the reduced schedule was announced, "It is time they got wise. They want to see a car or two at the finish."

The 20 miles an hour schedule for touring cars is reduced to 16 miles and the 18 miles schedule for runabouts to 14 miles an hour.

"They want to make a walking match of it," grieved one of the officials when the notice was posted.

The start tomorrow is at 7:30 o'clock. The noon control is at Prescott, Ark., and the running time for the runabouts is 9 hours 55 minutes, and for the touring cars 7 hours 40 minutes. The Red River must be crossed in a ferry—a flatboat that takes only one car at a time. This means another long wait at the banks of the stream, and afterwards the second essay at riding in the dark.

IN AN ALABAMA SWAMP—STRIKING ILLUSTRATIONS OF THE VILLIANOUS CONDITIONS ENCOUNTERED

## Dramatic Scene in Mississippi Forest; Another Day that Tried Men's Souls

Texarkana, Ark., June 20.—Though members of the technical committee sneered at the reduced schedule of today's run from Hot Springs to this point, terming it a crawl, it was not so easy but that several cars were penalized heavily, which means that the road and the pace necessitated work on the cars, and one, the Premier No. 1, lost its perfect score that it retained amid the greater difficulties of the preceding days.

This Premier was penalized 7 points for refilling the radiator with water and adjusting the fan belt; Premier No. 2 was penalized 10 points for labor; Chalmers No. 4, 9 points for work; Parry No. 9, 8 points; Cino No. 15, 78 points; Moline No. 101, 192 points; Moline No. 102, 2 points. The Chalmers was penalized for filling with water out of control; the Parry also incurred a water penalty and repaired the steering gear. The Cino was late with a mended steering wheel. The Molines which were fined repaired a radiator leak and refilled with water. The Falcar repaired a magneto and filled with water inside the prescribed hundred miles. Only two of the cars now reported in arrived late, but sev-

eral came in barely by the skin of their teeth, so to speak.

Of the day's episodes the most startling was the hold-up of Moline No. 100 by a vicious New York looking darkey with a team of mules and a shotgun, who was encountered at a turn in a wood road between Oklahoma and Boughton. Springing from the wagon loaded with his family, the negro stood by the head of his restless mules and pointing his shotgun at C. H. Vandervoort, ordered him to stop until the mules quieted down.

"But your mules are not scared and I am in a hurry," protested Vandervoort, looking down the muzzle of the shotgun without a quiver.

"No difference; I kaint have them mules run away, no how," replied the darkey.

How long the holdup might have lasted and what the result might have been were settled by the arrival of the Cadillac "Gunboat" driven by Major Davidson and carrying cadets of the Northwestern Military Academy. Before the negro realized the nature of the reinforcements, Major Davidson had him covered with a revolver and the four cadets followed suit. "Hands up!"

ordered Major Davidson in the southern white tone that brings negroes to obey on the run; and this one was no exception. He held up his hands while one of the cadets approached under cover of Major Davidson's artillery and took away his shotgun; he discharged it, then broke it over a log and threw the pieces into the brush under the Major's commands.

"You fellows have been lynched around here for doing less than pointing a gun at white visitors. Don't you ever try anything of the kind again," was the parting command of Major Davidson.

C. M. Babbitt, the observer, abandoned the Cino car because he considered driver Walter Donnelly too dangerous for his safety. Donnelly threw one man out of his car some time ago and injured him, so when Donnelly started in by running into a stump and tossing the passengers and then ran off the road into a ditch, Observer Babbitt ordered him suspended and detailed another man to drive. Donnelly refused to be suspended and threatened to "lick" Babbitt, whereupon the latter left the car.

Follow the leader was the order with the

Gliddenites today. They trailed the pace-maker from 7:30 in the morning until 7:30 at night, dodging stumps, wallowing in mud holes, climbing steep grades on the low gear and coasting down steeper declivities on the brake. It was a day of hard work, considerable danger and complete fatigue. The tourists thoroughly realize by this time that it is a test of human endurance as well as of the stability of machines. Those who participated in former tours say that this is far ahead of its predecessor in strain upon the men, as it is in point of test of the cars. Many of the drivers and passengers are as nearly "all in" as are many of the cars. The heat is terrific to the northern born, and the length of the day's run from control, to control is felt as a drain of energy.

Tonight the drivers and passengers are thanking David Beecroft for putting through the demand that today's schedule be cut down from 20 to 16 miles for touring cars and from 18 to 14 miles for runabouts. It is said he had a hard fight in the technical board last night. The rest of the committee insisted upon maintaining the daily grind of 20 and 18 miles, but Beecroft stood up and voiced the general demand for a schedule suited to the day's work. It is the consensus of opinion that

the most part ox cart trails. The inhabitants chiefly are negroes and semi-occasional poor whites with the invariable swarm of dirty barefoot children and several nondescript curs, together with any number of razorback hogs fraternizing in

of all the Gliddenites on edge.

The rule of the pilot car seemed to be "of two roads choose the worst." In many instances it left the main highway to strew the confetti along ox cart trails, returning to the main roads four or five miles further on,

PART OF THE "BAGGAGE TRAIN" IN A "PICTURE" COUNTRY

GLIDDEN EDUCATIONAL CONTINGENT GIVING ONE OF ITS "FIRST LESSONS"

would have come through at all and none with their scores and parts intact.

It was a day of rough roads, although not to be compared with those of Kentucky, Tennessee and Mississippi of evil memory. The route lay through the "Yaller Dog" section of Arkansas made notorious by the "Arkansaw Traveller" and other humorists. It was a land of almost incessant woods covering a hilly country and with roads for

the front yards or under the houses or taking siestas in puddles in the roadway. It was a free-for-all obstacle race trying to dodge rocks, ruts, stumps, rush creeks too quickly to be stuck in the mud and keeping a sharp lookout for holes in the sand that menaced frames and axles and often sent the passengers ballooning with curves. It was excessively hot and the long day's work and short sleep have put the nerves

like the bark of the dog in the Britisher's conundrum. This appeared to be designed to make the proposition more difficult.

"What came we out to this wilderness for to see?" the car owners often asked themselves while the cars trailed wearily and jolted up and down hills, too poor to produce anything but a little cotton and trouble. The natives certainly do not look like prospective customers. Appearances indicated that if a collection were taken of most of the group it would have to be finished without getting the price of a pair of goggles.

The villages and villagers of Social Hill, Friendship and Arkadelphia appeared to regard the tour as the great show of their lives. Prescott, where the noon stop was made, presented the tourists with baskets of peaches that had ripened on the Alberts farm a few miles away. Emmett and Hope were crowded with applauding thousands, and Fulton capped the reception with true southern hospitality, in the shape of bottles of beer in tubs of ice, sandwiches, cigars; and for all who followed the charon, who ran the ferry across the Red river at this point, there was a nip of pure Bourbon whiskey behind an adjacent shed. The cars were taken across three at a time by means of an old-fashioned rope ferry.

It rained hard along the route yesterday, the only rain in three weeks. It was said that had the original plans of the contest board been carried out, to run all the way to Texarkana from Little Rock, it would

have been just in time to hit this rain at a 20-18-mile schedule, and in this event the tour would have been a grand smash yesterday.

The run of 217 miles tomorrow to Dallas will start at 6 o'clock; the touring cars are allowed 12 hours 5 minutes for the trip and

runabouts 13 hours 21 minutes. This will be the first time two schedules will be used, a slow one for low gear work to Paris, the noon control, and a fast one from there on.

Late reports tonight announce that the Ohio No. 11 has withdrawn with a cracked

cylinder and was seen heading for Hot Springs. Westcott No. 111 also withdrew, and was shipped back to the factory from Arkadelphia; its water radiation was gone.

The Lexington, traveling as a non-contestant, arrived here after 10 o'clock tonight.

## Two More Cars Succumb; Texas is Torrid but Dallas Enlivens the Despondents

Dallas, Tex., June 21.—Two more cars went down and out today. The Cino broke an axle a short distance from Texarkana and the Falcar broke its differential gear 35 miles out from here. Its driver sent to the city for a new gear and axle, but as the rules eliminate any car, as a competitor,

the brute, as he did not bark as did the rest of the dogs which have chased the cars lately. Suddenly, however, Kurecki felt something strike the back of his head and when his companions in the car heard a violent exclamation from him, they looked around and saw the bloodhound hanging

Nashville, Nashville to Sheffield and Sheffield to Memphis.

There was a Sirocco blowing over the cars and wilting the occupants at nearly all times during the day. The Gliddenites in all their experiences never encountered such terrific heat, the temperature being aggravated by humidity due to a heavy rainfall yesterday. The Moline cars, which are the only ones carrying tops, had the best of the sun, but even their occupants found it necessary to raise the windshields in order to keep the wilting air out of the cars. It was found to be cooler without any current of air at all than to sit in the waves of furnace heat that swept in under the tops.

The first part of the trip today appeared for a time to be the last straw. The roads were fearfully rough. There was not more than an occasional minute when the occupants of the car were not being shaken up, jostled, bounced, tossed and jolted over the rough roads. There were stones covered with sand; there were holes filled with dust; there were tree stumps to be dodged, and all of the time the occupants of the tonneau were being tossed about like kernels of corn in a popper. These roads lasted through the black belt, and were merely wood roads. But approaching Annona there was noticeable an improvement.

At Paris there was a good lunch provided. From Paris to Dallas, 130 miles, there were encountered the best roads that were met with up to this time on the tour. They were smooth and had recently been gone over with split log drags. Nor was this all that was done to make the visitors happy. The arrangements for the entertainment and care of the tourists were under the direction of the Dallas Automobile Dealers' Association, with the Dallas Automobile Club and the Chamber of Commerce assisting. M. A. Sacksteder is president of the dealers' organization and George W. Baker is president of the owners' club.

Months ago the dealers set out to secure the 1910 Glidden tour for Texas. A special car made three trips to Texarkana logging the route and escorting the pathfinder over the course, the expenses of the trips being borne by the dealers. Later, the effort to have Dallas made a night control was taken up successfully.

These two things accomplished, the dealers then started a good roads campaign, which has resulted in the grubbing of hundreds of stumps between New Boston and

THE ROUTE OF THE GLIDDEN TOUR

when it replaces any part with a duplicate that is not carried on the car, the Falcar can continue only as a non-contestant. In addition, Chalmers No. 3 was penalized 18 points for repairing its oil pipes and taking on oil; Chalmers No. 4, driven by Joe Matson, was penalized 8 points for taking on water, and Maxwell No. 7, driven by H. E. Walls, was penalized 4 points for adjusting the oil on the dash. Moline No. 102, driven by F. G. Salisbury, was penalized 6 points for taking on water twice, and Maxwell No. 107 was penalized 2 points for repairing a broken fan belt.

These were the results of today's run of 217 miles from Texarkana to Dallas.

Aside from these troubles, C. M. Babbitt, observer, set his khaki suit afire, but was not seriously burned, and John Kurecki, observer, in Moline No. 100, was attacked by a bloodhound. He was in the tonneau when a bloodhound glided out from a farm yard and pursued the car, which was going 25 miles an hour. No attention was given

on to the collar of Kurecki's khaki jacket. He had sprung at Kurecki over the back of the tonneau, and barely missed his neck. The companions of Kurecki in the tonneau picked an empty pop bottle from the bottom of the car and dealt the dog such a tremendous blow on the end of his nose that he released his grip on Kurecki's collar. The attack was entirely a surprise, as Kurecki and the other occupants of the car had not irritated the dog or done anything to excite him.

Today's run was the most enjoyable to date, because of the splendid roads for the greater part of the way. For the first part to the noon control at Paris, the committee set a reduced schedule of 16¼ miles an hour, and for the latter part, from Paris to Dallas, 20 miles an hour. This was regarded as the greatest joke of the tour so far, in as much as the committee gave the same running time for the best 100 miles of road yet encountered as for the carwrecking runs from Louisville to

Texarkana, the repair of many bridges, the erection of new ones and the grading of roads. In other words, the dealers of Dallas stirred up untold interest in good roads and in automobile touring.

The sun was setting and the moon was rising when the tourists arrived in sight of the city. Outside the limits a delegation of dealers waited with sandwiches, cigars and beer for the visitors. At 8:30 o'clock they escorted the visitors to a supper upstairs in the Oriental hotel.

## Cross-Tie Bumping Adds to Woe; Oklahomans Witness Procession of Sleepers

Lawton, Okla., June 22.—The contest committee today "treated" the Gliddenites to another novel and clever stunt. Like many preceding ordeals, this was almost a complete surprise. Tonight all of the tourists express themselves as more surprised than delighted over it. The unexpected ordeal consisted of running over two miles of railroad ties and crossing the Red river on a narrow bridge.

When the Gliddenites arrived there at 3 o'clock this afternoon, a flagman waved them up the railroad embankment, and arriving at the top they found themselves on a single track roadbed, the sides falling down abruptly from the ends of the ties from 10 to 80 feet. The ties were from one to two feet apart. For part of the distance to the bridge an attempt had been made to spread crushed stones between the ties, but it was very inadequate. The cars were forced to travel bumpety-bump, bumpety-bump, bumpety-bump over the ties. Sometimes the wheels dropped between the ties and held until all power was applied, when they would shoot ahead and bump more violently than ever. The passengers were so thoroughly shaken and rattled about that they got out and walked.

It took 34 minutes to make the dangerous trip, which came after 9 hours hard driving and jolting in a blazing Texas sun. The reason assigned for the ordeal was that the sand was deep in the bed of the river. But other cars crossed by the ford where the water was only ankle-deep. The drivers said that the pounding of the machines from tie to tie took more out of their machines than would 1,000 miles of ordinary driving. Leaks were discovered in several radiators afterward, and the drivers are satisfied that the shaking and jarring were responsible for it.

Cartercar No. 8 broke a right rear axle this morning. It is disqualified from the Glidden competition, but will accompany the tour as a non-competitor. Penalties were sustained by Premier No. 2, Ray F. McNamara driver, for filling the radiator with water inside of the 100-mile limit. Chalmers No. 3 was penalized 4 points for repairing fender, and Chalmers No. 4 was penalized 12 points for filling with water four times. Maxwell No. 7 was penalized

Tomorrow's schedule for the 200 miles to Lawton, Okla., is 12 hours 25 minutes for the runabouts and 11 hours 3 minutes for the touring cars. The start will be at 6 o'clock. From here to the noon control at Terral there will be a reduced schedule for two hours on account of sand.

David Beecroft is acting chairman of the contest committee in the absence of Chairman Butler, who had business to attend to, but who expects to rejoin the tour at Kansas City.

The interest in the tour today, especially in the white man's Texas, was enthusiastic. From Anona to Dallas is the garden spot of the Lone Star state. The tourists found it a succession of corn, oats, and cotton fields, the corn being in the ear and six feet tall. There were many fruit orchards also. In this wealthy district lives a hospitable and well-to-do class of people, many of whom own automobiles, and they turned out and gave the visitors a continuous ovation.

43 points for a new spring clip, new radius rod and adjusting the fan belt. The Parry No. 9 was fined 155 points for a new spark

rubble-covered slopes, over which the cars stepped as gingerly as a bare-footed boy in the spring. The rubble was succeeded

ONE OF THE MANY GATHERINGS AT THE MANY CROSSROADS

plug, repairing the magneto, a new starting crank and repairing the radiator. Molines Nos. 101 and 102 were penalized 3 points for filling the radiator. W. H. VanDervoort attributed the rapid evaporation to the intense heat. Cole No. 104, Parry No. 105 and Falcar No. 106 have not reported.

The near-slack wire performance of crossing the ties of the railroad bridge added 34 minutes to the 13 hours' schedule. Besides, the tourists were held up for a half hour at Fort Worth. Why, has not been discovered. There was no reception or public or private function. The cars were simply halted before a hotel and the Fort Worth populace came and looked at the cars and occupants, drinking in the spectacle with open mouths. When their curiosity was satisfied, the cars were allowed to proceed.

Every acre of land up to Hicks seemed to be under cultivation, then the horizon broadened out upon treeless plains. A few miles beyond Hicks trouble began for the cars. The roads degenerated into

by many stretches of sand and stumps. The sand was deep and the stumps were many. For 52 miles the going was hard, then it improved, but grew worse again, until Temple was reached. From there to Lawton the road generally was good. Most of the roads encountered in the day's run were merely strips of prairie fenced in and the wheels did the rest. They never had been worked. Some of them were smooth, but the majority were poor or worse.

A noticeable feature of the day was the lack of the usual fervor along the way. "There was no enthusiasm in the rural districts," as State Chairman William J. Connors was wont to explain in connection with the Hearst defeat. Very few people seemed to take any interest in the trip. Farther along in Oklahoma the few people seen along the route had for them a rare treat. They saw car after car go by with the occupants of the tonneaus fast asleep. Over the bumps the schedule was 14 hours. Added to this was the 43 minutes at the noon control, so that altogether the

Gliddenites were compelled to drive nearly 15 hours in a suffering heat to gratify some whim. They are dead tired; so tired that asleep in the tonneau not even a hard jounce awakens some of them.

The noon control was at Terral, Okla., a small place, and there were no accommodations for food. Some women were selling cake and lemonade for the benefit of the local Methodist Church. The Gliddenites after one taste of the cake made a heave offering of it. Under the schedule, it was nearly dark when the tourists arrived in Lawton. At the outskirts of the town the cars were stopped by a man with a red flag. The flag indicated that there was danger of a drink being found in the vicinity. It was located in an automobile

by the circuit court, and the Supreme Court merely affirmed the decision of the lower court, holding that inasmuch as Himmelwright, being thoroughly familiar with the speed, power and handling of motor cars, did not observe due caution, he himself was responsible for his being run over.

#### Favor Cross-Continent for Glidden.

Although the present Glidden tour is not yet completed, and the ruffled tempers which usually follow such strenuous events still remain to be smoothed, officials of the Premier Motor Mfg. Co. have let it be known that they not only favor the continuation of the contest, but a still longer route. H. O. Smith and G. A. Weidely, president and vice-president, respectively,

a most literal interpretation of the case, merely asserting that the machine was in charge of and under the control of the applicant, who was operating the machine with a representative of the highway commission sitting in the machine.

#### Provisions of Virginia's New Law.

On June 15 the new automobile law of Virginia went into effect. It requires the registration of chauffeurs, who must display the license badges, and fixes the fees for registration of motor cars according to horsepower—\$5 for cars under 20 horsepower, \$10 for cars possessing over 20 and less than 45, and \$20 for cars having over 45 horsepower. In the open country speeds of 20 miles an hour are permitted, while in settled districts 8 miles per hour is the limit. Touring non-residents who have complied with the laws of their own state and display the registration number of that state may use the highways of Virginia for two periods not exceeding seven days each in each calendar year.

#### Gasolene Famine Again is Predicted.

State Oil Inspector Longshore of Kansas has gone on record as saying that a gasolene famine is imminent. "The consumption of gasolene during the month of April of this year has increased 46 per cent. over the same period of last year," says the inspector; "and of course is due solely to the enormous increase in the number of automobiles driven in this country. The gasolene supply of the world is beginning to fall off slightly, in comparison to the increased demand, and unless some new oilfields are discovered or the distillation process improved, the automobile trade will find itself face to face with the serious problem of shortage of gasolene."

#### Good Roads Congress at Niagara.

The executive committee of the Good Roads Association, which met in Washington last week, selected July 28 to 30 as the dates for the third annual congress of the association. The gathering is to be held at Niagara Falls, N. Y. Arthur C. Jackson, president of the association, has requested officials of every state, county, city or town in the country and all agricultural, automobile, educational, commercial, industrial, good roads, labor and transportation organizations to send delegates.

#### Prohibits Minors from Driving Cars.

At the meeting of the city council of Lawrence, Kan., on June 14th, an ordinance was passed prohibiting any minor under 18 years old from driving an automobile on the streets of Lawrence, under penalty of a fine of from \$1 to \$25. The ordinance met with considerable opposition from various automobile owners who had sons between 16 and 18 years old, who had been accustomed to run their parents' cars.

TIRE CHANGING HAS BECOME SECOND NATURE—COUNT THE SPARE TUBES

near by, the gift of the motorists and prominent citizens of Lawton.

The run tomorrow being only 143 miles, the start will be made at 7 o'clock.

No one will be sorry when Chicago and the finish of this nightmare is reached on the evening of the 30th. Next Sunday's rest in Kansas City may revive some of the sorely-tried, but with seven days' travel still in store and four of them calling for more than 200 miles each day, the prospect fills none with unwonted glee.

#### Knowledge Has its Drawbacks in Kansas.

That a man who knows all about automobiles, their speed and the control of them, cannot collect damages from an automobile owner in case he is run down and injured, is the gist of a decision of the Kansas Supreme Court. E. H. Himmelwright of Wichita, Kan., was the person. He himself is an automobilist, but he was afoot at the time he was hurt by an automobile driven by Hattie M. Baker. He sued for damages, but the case was thrown out

of the Premier company, have placed themselves on record as favoring a cross-continent journey from New York to San Francisco for the 1911 Glidden contest and pledged themselves to do their utmost to effect this result.

#### Blameless for Applicants' Accidents.

By no less an authority than the Governor of Massachusetts himself, the highway commission of that state is absolved from responsibility for damages caused by an automobile in charge of an applicant for an operator's license who is undergoing examination by one of the commission's inspectors. It had been contended that under such circumstances the vehicle was under the control of the highway commission. One Frank Russell, of Concord, was injured in an accident under such circumstances and was instrumental in securing the passage of a resolve that he should be paid \$1,000 damages out of the state treasury. In vetoing the resolve, last week, Governor Draper contented himself with

## BALTIMORE'S THRILLING CLIMB

**Cars Compete in Ten Hotly Contested Events—Zengle Takes the Free-for-All, Breaking Old Record.**

Rushing through a living lane of thousands of spectators at the rate of 60 miles an hour, Len Zengle, of Pottstown, Pa., drove a Chadwick car to victory in record breaking time in the free-for-all class at the Automobile Club of Maryland's second annual climb on Belvidere Avenue hill, Baltimore, on last Saturday afternoon, 18th inst. Entered solely in the stellar event, on the capture of which his energies were concentrated, the young Dutchman sent his big flier up the six-tenths of a mile incline in 36 seconds, clipping  $7\frac{1}{2}$  marks of the watch from the old figures. It was a brilliant performance and elicited loud cheers from the crowd which lined the course. Another near neighbor of the Chadwick, the Matheson, with L. H. Shaab up, ran second with a flight in 44 seconds. Wilfred Smith, Chadwick, was third, making the climb in 2 seconds slower than his predecessor.

Matheson cars were particularly conspicuous in the winning column, taking 3 firsts in addition to second in the big class. Edgar Dobson, a local amateur, twice drove his Matheson to victory in fast time. His first win was the \$2,001-\$3,000 class open to all, where he easily outclassed Janin in a Chalmers. Dobson crossed the finish line in  $50\frac{1}{2}$  seconds, winning by a liberal margin. C. R. Meisner, Oldsmobile, was a poor third. Dobson's best performance was made in the amateur class for cars costing under \$3,000. He swept up the 15 per cent. grade in  $48\frac{3}{4}$  seconds, the best time made in any of the amateur events. Harry Reis, Chalmers, reached the end of the route in  $58\frac{3}{4}$  seconds and William Delow, Crawford, required  $1:03\frac{3}{4}$ . Matheson colors came to the front again in the \$3,001-\$4,000 class, when L. H. Shaab drove one of the Wilkes-Barre built cars to the winning tune of 47 seconds. John Goodwin, the only other starter in this class, did it in 58 seconds.

Stearns cars also were consistent performers, J. G. Nassauer in one of them scoring two firsts. He won the \$4,001 and over class in  $51\frac{3}{4}$  seconds, beating out J. R. Dungan, Chadwick, by  $\frac{1}{4}$  of a second. That these two cars were very evenly matched again was demonstrated in the amateur class for cars costing over \$3,001, when Nassauer took first from Lanahan, Chadwick, by  $\frac{1}{2}$  of a second, making the trip in  $51\frac{1}{4}$  seconds. The little Hupmobiles made a clean sweep in the low-priced division, running one, two, three. T. W. Simpson held the wheel of the winning car, and registered  $2:06\frac{1}{2}$ . In the motorcycle

## THE MOTOR WORLD

class Chic Thomas, Indian, closely approached Zengle's high water mark, making a spectacular climb in 39 seconds, 4 seconds faster than his nearest rival.

The summaries:

### Class A—\$800 and Under.

T. W. Simpson, Hupmobile.....	2:06½
Nat Tuttle, Hupmobile.....	2:25½
T. D. Smith, Hupmobile.....	3:21½

### Class B—\$801-\$1,000.

H. A. Bauer, Oakland.....	1:43
Harry Reis, Warren-Detroit.....	1:46½
A. M. Eastwick, Ford.....	1:53
A. S. Zell, Hudson.....	1:56¾

### Class C—\$1,201-\$1,600.

G. B. Hal, Buick.....	0:57¾
M. C. Jones, E-M-F.....	1:06½
A. A. Miller, Crawford.....	1:07

### Kansas Fair Provides for Motor Exhibits.

At the meeting of the directors of the Kansas State Fair Association a few days ago, it was decided to build a garage 300 feet long and 100 feet wide for the motor car show which will be held there during Fair week. During former fairs motor car dealers had no inducement to bring their cars and exhibit them where there was no shelter for them. It is expected that the motor car exhibit will be a prominent feature of the Kansas State Fair each year hereafter.

### Wichita Club Chooses New Officers.

Wichita (Kan.) Automobile Club—President, Geo. W. Walker; vice-president, F. A. Amsden; treasurer, Color Sims; secretary, Ralph Millison. Directors: Henry Lasson, S. B. Amidon, S. W. Hess, Ralph Millison, G. W. Walker.

## MORGAN SAYS HE IS "THROUGH"

**Declares that His Mantle is to Fall on Ferguson's Shoulders—The News May (or may not) Prove True.**

W. J. Morgan, who has played many parts in many places during many years, says he's "through," that is, that he has dropped at least one of his aliases, to wit, Motor Contest Association. Nevermore—or hardly ever—will he employ it again. He has turned over the name to E. L. Ferguson, and unless Ferguson has the invisible assistance of Morgan it fairly is certain that he never will be able to put it to such uses as it was put by the "association" himself. Ferguson is not built exactly that way, nor is he particularly well positioned so to do.

Morgan's "farewell" followed his "Montauk Light or Bust" affair. In it he declared that nevermore would he have to do with the promotion of such things—he is through with them forever and ever, even to the "Amen"—perhaps. He had made similar announcements before, but never in print, so he appears to think he means what he says. Morgan's withdrawal will be viewed with conflicting emotions even in the New York trade, on which he so frequently has drawn. For his little excursions, denominated reliability runs, etc., which periodically he organized since he incorporated himself as the Motor Contest Association, have been viewed in two lights. Some of those who participated considered them fine picnics or junkets, while some of those who paid the bills viewed them as—well, they will feel relieved if Morgan's proves a real farewell. The hotel keepers, on the other hand, scarcely can escape a pang of regret. They had grown accustomed to being "seen," and as Morgan generally "delivered the goods" at their doors, the "usual arrangements" appeared to be mutually satisfactory.

It was as a hotel boomer that Morgan first brought Morgan into notice in the automobile world. He promoted and managed the Ormond beach speed carnival for several years; and although lots of people never knew or even suspected it, Morgan was in the hotelkeepers' employ and the carnival merely was a scheme to bring boarders to their hotels during a slack period.

Nominally, Morgan is "auto editor" and advertising solicitor for a New York afternoon paper, but as a deputy motor vehicle commissioner he also draws \$75 per month from the State of New Jersey. He, however, is worth much more to the commissioner himself, as one of his chief functions as "auto editor" appears to be printing "sweet nothings" about the man higher up.

**BREEZY MEET AT POINT BREEZE**

**Philadelphians See Eight Lively Events—  
De Palma and Bergdoll Shine—Storm  
Shortens the Big Race.**

Ralph De Palma and his Fiat renewed acquaintances with Philadelphia motorists at Point Breeze track on Saturday last, 18th inst., at the Quaker City Motor Club's fourth annual meet, and incidentally left a reminder of his visit in the shape of a new 5 miles record for the track, superseding the old mark which he established last year. The new figures are 5:13, a reduction of  $1\frac{3}{4}$  seconds. This really was De Palma's most noteworthy performance, for rain spoiled the premier event, the 50 miles free-for-all being stopped in the 30th mile with De Palma leading, and E. R. Bergdoll, Benz, second.

Bergdoll, the local amateur, shared the spotlight with the Italian star, taking two firsts and one second, which was the best showing made by any driver. What few morsels were not swallowed by the big fellows went to local talent. The 25 miles race was scratched for lack of entries, and had not the trade come to the rescue at the eleventh hour and extended liberal support, the meeting undoubtedly would have been a failure. Until the rain started the track was in excellent shape.

While it lasted the 50 miles race was a good one, and the close rivalry between De Palma and Bergdoll for the leadership kept the crowd on edge. Eight cars breasted the tape for the half century jog, but only seven really figured in the struggle. One of the Klinecars was left at the line and lost a lap before it got under way. De Palma jumped to the front at the gun, making a pretty getaway, and immediately started to open up a gap with Bergdoll in the Benz pressing him close. In the ninth mile the other Klinecar dropped a lap to the leaders, and in the next circuit De Palma passed the Chalmers and Jackson. Bergdoll was dogging the leader close and was going strong.

During the succeeding ten circuits De Palma crept away from his pursuers, and at the 20 mile post was nearly half a lap to the good, leading Bergdoll by 26 seconds. At the halfway mark the storm broke in full fury and the rain came down in torrents, while the lightning played across the sky and the thunder drowned the roar of the engines. The track soon became a slimy mass, but the drivers stuck to their work, the cars skidding dangerously and throwing great showers of mud and water as they plowed along. The storm dampened the ardor of several of the contestants, who dropped out, but the leaders continued to battle with the elements. After

consultation the judges decided to stop the race to avoid possible accident, and the cars were called off at the 30th mile. De Palma was awarded the race. Bergdoll was second. These were the only ones to finish.

A popular favorite with the crowd of 15,000 people who witnessed the meet, Bergdoll wasted no time in getting his stride, and opened the festivities by winning the first race out of the box, the five miles for amateurs. There were three starters, and Longstreth jumped the others at the gun, gaining a big lead, but Bergdoll went right after the runaway and eventually caught him after a stern chase which brought the crowd to its feet. He won by a good margin, the time being 6:01 $\frac{1}{4}$ . Harvey Ringler, Klinekar, the other starter, was never dangerous. Continuing his ascent of the ladder of victory, Bergdoll again sent the Benz over the line first in the 10 miles race, easily outdistancing Beardsley, Buick. Richards, Chalmers, took third. The time, 11:42 $\frac{1}{4}$ .

A record breaking field of 32 starters lined up for the one mile speed judgment test, the driver completing the circuit nearest to three minutes being adjudged the winner. Fred Dyer Selden, proved the best judge of pace by completing the mile in 3:02 $\frac{3}{4}$ . Longstreth, Alco, was second.

De Palma's time trial was a pretty exhibition, and, as previously told, he got under his old mark for the track. The pursuit race, which was won by Burns, Autocar, was a four-cornered affair, four cars starting from equi-distant points. It required six miles for the winner to wear down the field.

Making its debut in competition, the Otto, a local product driven by Jones, captured a five miles race handily in 6:04. Oliver, in a Mercer, was second.

The summaries:

Five miles amateur—Won by E. R. Bergdoll, Benz; second, W. C. Longstreth, Alco; third, Harvey Ringler, Klinekar. Time, 6:01 $\frac{1}{4}$ .

Five miles—Won by Scott Miller, Warren-Detroit; second, James Gray, Schacht; third, Blind, Black Crow. Time, 7:49 $\frac{3}{4}$ .

Five miles—Won by George Jones, Otto; second, W. Oliver, Mercer; third, Clifford Ade, Pullman. Time, 6:04.

Ten miles—Won by Bergdoll, Benz; second, Beardsley, Buick; third, Richards, Chalmers. Time, 11:42 $\frac{1}{4}$ .

Five miles time trial against track record of 5:14 $\frac{3}{4}$ , held by himself—Ralph De Palma, Fiat. Time, 5:13.

One mile speed judging contest—Won by Fred Dyer, Selden; second, W. C. Longstreth, Alco. Time, 3:02 $\frac{3}{4}$ .

Pursuit race—Won by Burns, Autocar. Distance, 6 miles.

Fifty miles free-for-all—Won by De Palma, Fiat; second, Bergdoll, Benz. Race stopped at 30 miles on account of rain. Time, 39:59.

**HONORS FALL TO THE SMALL CARS**

**New Jersey's Postponed Mud Plug Gives  
Perfect Scores to Eleven—Jupiter  
Pluvius Takes a Hand.**

Had the officers of the New Jersey Automobile and Motor Club of Newark been able to look into the future on Saturday, the 11th inst., it is probable that they would have decided to hold the organization's annual endurance run as per original schedule (despite the rain), instead of advancing it one week to the 18th with the hope of being favored with more auspicious weather and roads. It would seem as if old J. P. just had decided that dry weather contests were altogether too easy and that those who intended to seek perfect scores this year must be able to overcome his forces, in addition to the time schedule. As it was, 11 of the 34 who braved the elements survived the 290 miles mud plug without having any derogatory endorsements affixed to their credentials.

It is particularly noticeable that the perfect score division is entirely made up of low and medium priced cars, not one of the high priced representatives securing the coveted cipher rating. Following are the perfect performers: I. M. Upperco, Cadillac; L. J. Wyckoff, Ford; James W. Ward, Buick; F. L. C. Martin, Hupmobile; A. H. Humphreville, Hudson; W. J. Tynan, Columbia; F. L. Kramer, Jackson; J. C. Bell, Buick; E. D. Carlough, Franklin; W. E. Shuttleworth, Haynes, and J. W. Mason, Maxwell. W. E. Davenport, Buick, lost a perfect score by a traffic hold-up in Newark, and having made an otherwise faultless performance, a protest which was made against the penalization for this cause being allowed to stand. After deliberating however, the contest committee disallowed the protest and upheld the action of the observer.

As nearly always is the case, there was a shrinkage in the entry list when starting time arrived, and of the 42 nominees only 34 took the flag at 5 o'clock Saturday morning. The course was over a circuit leading through Hackettstown, Montclair and Dover, to Budd Lake, and returning via Washington, Flemington and Somerville to Newark, the distance being 145.3 miles. The circuit was covered twice, making a total of 290.6 miles. The running time was 15 hours. Officials and contestants are unanimous in declaring that the contest was the most strenuous and grilling motor function ever pulled off in the state, and that all previous club contests pale into insignificance by comparison.

Hardly had the cars left the starting post when J. P. gave notice that he would commence operations, and the threatening clouds which had been lowering for several

hours began to weep. This preliminary shower, however, was light and, in fact, was rather welcome, as it served to lay the dust. The rain stopped in a few minutes and all hands hoped that it had ceased for good, but disappointment was in store for them, for Hackettstown had not been sighted when a genuine downpour set in. Soon the roads were very greasy and chains were the order of the day, the cars performing all sorts of fancy evolutions short of standing on their beam ends. Owing to the law prohibiting the use of chains on macadam roads, except when there is an inch of snow on the ground, the chains were not applied until the cars were on the country highways.

Near Hackettstown existed the worst stretch on the course, and although spe-

resuscitate the motor long enough to enable the car to reach the control, the penalty for taking on fuel outside could not be escaped. Fisher had no other assessments charged against him.

The results in detail are given below:

#### Penalizations.

##### Class A—Touring cars, under \$1,600.

Entrants and Cars.	1st	2d	
	C'l.	C'l.	T'l.

E. S. Hilton, Regal.....	*		

##### Class B—Touring cars, over \$1,601.

	0	0	0
J. C. Bell, Buick.....	0	0	0
J. W. Ward, Buick.....	0	0	0
E. W. Carlough, Franklin.....	0	0	0
J. C. Bell, Buick.....	0	2	2
H. F. Seibert, Amplex.....	3	0	3

practically all of the honors in the New York-Atlanta Good Roads tour, June 6-13, the results of which were officially given out this week, only one entrant from the northern states figuring in the perfect score division. When the officials had exhausted all legitimate means for spotting the records of the contestants with demerits, there still remained eight unblemished cars out of the 62 starters. The lucky octet were the following: E. M. Willingham, Atlanta, Ga., Ford; D. K. McColl, Bennettsville, S. C., Cadillac; James A. Gray, Winston-Salem, N. C., Mitchell; Norman Gallatin, York, Pa., Pullman; Marcellus Rambo, Birmingham, Ala., Columbia; E. H. Inman, Atlanta, Ga., Pope-Hartford; E. M. Durant, Atlanta, Ga., Pope-Toledo; Asa G. Candler, Jr., Atlanta, Ga., Lozier.

KRAMER (JACKSON) WHERE THE GOING WAS GOOD AND SHUTTLEWORTH (HAYNES) DESCENDING DRAKE MOUNTAIN

cial officers were out, and notices were posted warning the motorists to remove the chains in passing through the town, they took a chance and were not molested. Much tire trouble also was experienced, the most unfortunate sufferer in this respect being Philip Hilton, Fiat, who had 5 blowouts in 5 miles. When the last one occurred, near Flemington, the car crashed into a bridge and sustained damages which necessitated its withdrawal. The first car to be eliminated was F. L. C. Martin's Hupmobile No. 30, which skidded on the wet asphalt in Newark and crashed into the curb.

In the afternoon the sky cleared for a time; then a cloudburst accompanied by hail caught the enduranciers and made driving anything but a pleasure. It was the worst storm the state has experienced in years, and filled the motorists' cup of discomfort and ill humor to overflowing.

One of the peculiar incidents of the contest was the unusual circumstance connected with the penalization of Clarence Fisher's Cadillac. It ran out of gasoline almost within sight of Flemington control, and although a couple of pints sufficed to

#### Prizes Awarded Southern Tourists.

As was expected, in view of the overwhelming number of entrants from that section, Southern owned cars carried off

In three of the classes two cars each tied for the stellar honors as follows: Division 3A—\$1,201-\$1,600, Cadillac and Mitchell; Division 5A—\$2,001-\$3,000, Pullman and Columbia; Division 7A—\$4,001 and over, Pope-Toledo and Lozier. The other perfect cars captured their class honors unequivocally as indicated: Division 2A—\$801-\$1,200, Ford; Division 6A—Pope-Hartford. In two divisions there were no perfect scores, and the awards were allotted according to the lowest penalizations, the winners being the following: Division 1A—\$800 and under, N. W. Wallace, Jr., Charlotte, N. C., Hupmobile, 20 points; Division 4A—\$1,601-\$2,000, W. E. Wimpy, Atlanta, Ga., Buick, 108 points.

In his report, Referee Charles J. Edwards, of New York, recommended that W. J. Stoddard, Atlanta, Ga., National, who was penalized 42 points, and R. E. O'Donnely, Atlanta, Ga., Packard, who was docked 4 points, should receive some special recognition on account of their meritorious performances despite the penalties incurred. The management has promised to give the suggestion consideration. Winners had the choice of cash, plate or cups.

**UP SUNSET HILL AT OSSINING**

**Disbrow Breaks the Course Record—Jones,  
Taylor and Fink Score—Spectacular  
Accident Precedes the Start.**

Louis Disbrow and his Knox car took another fall out of Father Time at the Upper Westchester Automobile Club's annual climb on Sunset hill, Ossining, N. Y., on Saturday afternoon last, 18th inst., by flashing up the seven-tenths of a mile slant in 57:34 seconds, thus establishing a new course record. The old figures stood at 58 seconds. It was in the third event, open to cars having a displacement between 301-600 cubic inches that Disbrow got under the old figures, and he had the distinction of being the only driver to achieve that honor, although it is probable that an even lower mark would have been set had not a severe electrical storm put a stop to the contest after four classes had been run. Thomas Kincaid, the National crack, was runner up to Disbrow, being clocked in 1:00:08. S. H. Clapp, Berkshire beat out Martin, Houghton-Rockwell, for third place.

Pope-Hartford cars took the cream in the class for cars under 300 cubic inches, winning both first and second. B. C. Fink was at the wheel of the winning car and made an excellent flight in 1:00:19, the second fastest time of the day. H. C. Holt handled the other Pope and had no difficulty in beating out Fred Horton, S. P. O. Joe Taylor, who has been campaigning with the Correja in the East, added another scalp to his belt by winning his class, the \$1,200-\$1,600 division. His time was 1:11:79. W. Varney, Buick, accounted for second, and Arthur See, Maxwell, landed third place. Charles Jones, Buick, was the only competitor in the low-priced division for cars selling under \$1,200, and consequently enjoyed a walkover. His mark was 1:33.

A spectacular accident marked the contest, and that no fatality resulted seemed miraculous. While an Amplex car driven by Walter Jones was practicing previous to the start the front wheels struck a rock imbedded in the road near the finish, the steering wheel was wrenched from Jones's grasp, and the machine plowed along a gully by the side of the road until it struck a tree. Jones and a companion were thrown out and the car was badly smashed, but the occupants escaped with a few scratches. A large crowd was present, many of whom came on foot, and were well drenched before they could reach cover when the storm broke.

The results:

\$1,200 and Under.	
Charles Jones, Buick.....	1:33.57
\$1,201-\$1,600.	
Joseph Taylor, Correja.....	1:11.79

**Manhattanites Hold a "Paper Chase."**

New York motorists were introduced to a new form of "contest" on Wednesday of last week, 15th inst., when the Motor Racing Association, which heretofore has confined itself to the promotion of 24 hours races, departed from its schedule and put on a "paper chase," otherwise a game of hare and hounds. The "hares" were J. E. Demar and W. I. Fickling, and they started from the association's headquarters in West 58th street, half an hour ahead of the "hounds." The only method of tracing the hares was by confetti which they scattered at turns and crossings. None but the referee knew the destination, the hares being given sealed envelopes which were opened 10 miles from the start and which indicated the remainder of the course they were to follow.

Some 25 cars acted as hounds, but the keenest of them was H. U. Palmer, in a Palmer-Singer, who was the first to overtake the hares; he caught them within a mile of the finish, at the Manhattan Beach hotel, 33½ miles from the clubhouse, in 1 hour 10 minutes after starting. Palmer was awarded the trophy offered to the hound which first caught the hares before they reached their lair. Shortly after Palmer captured his quarry, W. L. Colt and H. L. Stratton in Cole cars also tracked the hares to earth. When all of the hounds arrived, the party adjourned to Reisenweber's for dinner, which was followed by a vaudeville entertainment. The hounds were the following:

W. H. Owen, Rainier; Mrs. C. A. Flammer, Lozier; C. R. Teaboldt, Thomas; Charles Trewin, Pleiades; Harry Pike, Chalmers; C. H. Larson, Oldsmobile; J. C. Nichols, Croxton-Keeton; Jack Clark, Peerless; J. P. Stoltz, Croxton-Keeton; W. L. Colt, Cole; E. H. Broadwell, Thomas; H. L. Stratton, Cole; E. Lascaris, De Dion; Mrs. E. S. Partridge, Stearns; George Robertson, Simplex; George C. John, Studebaker; H. U. Palmer, Palmer-Singer.

**Monument to an Early Inventor.**

Growing appreciation of the value of the automobile is leading to the inevitable stage of hero-worship. A movement is on foot to erect a monument to the memory of Capt. Nicholas Joseph Cugnot, who, in 1769, constructed the first steam-driven motor vehicle for highway use. The project centers in his native town of Vard, department of Meuse, France.

**MEMPHIS HAS A MERRY-GO-ROUND**

**Contestants in Two Events on the Track  
Together—Robertson Wins Half the  
Races—Local Talent Competes.**

After shelving the scheduled racemeet at Tri-State park, Memphis, Tenn., for a month for lack of entries, Homer George, the New Orleans (La.) promoter, finally rounded up enough drivers to enable him to stage the function on Friday last, 17th inst., when Geofge Robertson easily proved the top liner of the talent present. He captured every race in which he started, which is to say that he won half of the events on the card. Smiling George treated the crowd, which was a fair sized one, to a few thrills by indulging in some spectacular driving in the time trials, which he won and in which he was not forced to extend himself at any time. The track was in good condition.

The feature contest was an innovation in track racing, and was of the merry-go-round style heretofore employed in the Vanderbilt cup race. It was a double header, consisting of two races in one, a free-for-all and a restricted class for cars not exceeding 344 cubic inches displacement, both at the same distance, 25 miles. Robertson won the free-for-all division, Ray Harroun in the Marmon taking second. In the stock class Bill Endicott drove a Cole to victory, and Edmunds in another Cole was second. Robertson's time was 25:37, and Endicott was clocked in 28:18. Endicott also distinguished himself by taking first money in the 5 miles for 161-230 class cars, Edmunds again playing second fiddle. Time, 6:09.

Harroun easily annexed the five miles handicap, and the \$50 attached to it, while Bill Endicott, Cole, took second money. The time, 5:37. Harroun registered another first in the 5 miles special, and his mate, Dawson, was the runner-up. Local talent was represented by R. H. Pennebaker, Stearns, who defeated Merriman, Thomas, for the city championship and the Business Men's trophy. The time for 5 miles was 6:01. In the time trials Robertson made the fastest time of the day, 0:55¾, and Ray Harroun came next with 0:58¾.

The summaries:

Five miles, stock chassis, 161-230 cubic inches—Won by Bill Endicott, Cole; second, Edmunds, Cole. Time, 6:09.

Mile time trials—Won by George Robertson, Simplex, 0:55¾; second, Ray Harroun, Marmon, 0:58¾.

Five miles handicap—Won by Harroun, Marmon (scratch); second, Endicott, Cole (0.27). Time, 5:37.

Five miles free-for-all—Won by George Robertson, Simplex; second, Ray Harroun, Marmon. Time, 4:59¾.

Five miles, Memphis championship—Won

by R. H. Pennebaker, Stearns; second, Meriman, Thomas. Time, 6:01.

Ten miles handicap, free-for-all—Won by George Robertson, Simplex (scratch); second, Dawson, Marmon (0.40); third, Harroun, Marmon (0.25). Time, not taken.

Five miles special—Won by Harroun, Marmon; second, Dawson, Marmon. Time, 5:19 $\frac{3}{4}$ .

Twenty-five miles combination free-for-all and stock chassis under 344 cubic inches displacement, free-for-all—Won by Robertson, Simplex; second, Harroun, Marmon. Time, 25:37. Stock chassis class—Won by Endicott, Cole; second, Edmunds, Cole. Time, 28:18.

## MOTOR CARS FOR ROOSEVELT'S USE

### Machines See Strenuous Service Incident to His Reception—He is Shortly to Buy a Machine for Himself.

Although the reception committee which organized the uproaring welcome-home to former President Roosevelt did not permit motor cars to play an official part in the festivities, because "they could not go slowly enough," the self-propelled vehicle was very much in the service of Mr. Roosevelt and his party during the day.

There were three White steamers at the Battery when the Roosevelt party landed, and all of Mr. Roosevelt's family and immediate party, himself excepted, entered

finally is about to purchase an automobile for his own use. During his term of office he of course made frequent use of the White steamers which formed a part of the official stable, but he was generally credited with being so much in love with the horse that he cared not to own a motor car.

#### New Rules in Massachusetts Laws.

Massachusetts motorists are relieved of the need of tooting for every corner they pass by the terms of the new horn law, which was signed by Governor Draper in connection with his approval of the group of bills which constitute the 1910 amendments to the motor vehicle law. Not only is it no longer compulsory to sound the horn at every street crossing, as formerly was required, but the quality of the tone permissible practically is regulated to that produced by the ordinary reed horn. As

INCIDENTS OF THE ROOSEVELT RECEPTION—IN WHICH WHITE STEAM CARS PLAYED AN IMPORTANT PART

iscent of the old-time "hand tub" of Colonial days, in that it is provided with a tank and at all times carries some 130 gallons of water. This is not so much for quenching fires, despite the fact that it is mentioned as a "first-aid" feature, as for priming the five-stage centrifugal pump with which the machine is equipped. This pump, which may be coupled to the 50 horsepower, four-cylinder engine by which the vehicle is propelled, has a capacity of nearly 400 gallons of water per minute at six atmospheres, or 88 pounds pressure per square inch and a little over. In the Gaggenau type, which is very completely equipped as to ladders and hose, speeds up to 25 miles an hour can be attained.

#### Two New Clubs Formed in New Jersey.

Hon. J. B. Crispin is the president of the Salem Automobile Club, which has been organized in the New Jersey town of that name. The vice-president is N. S. Hires; secretary, W. M. Waddington; treasurer, Paul Erhardt.

The Sussex Automobile Club has been formed in Newton, N. Y., with twenty charter members and these officers: President, Dr. J. N. Miller; vice-president, Dr. Morrison; secretary, W. W. Woodward, Jr.; treasurer, Edwin M. Quick.

these cars and were driven to Mr. Douglas Robinson's house at 433 Fifth avenue.

In the meantime two more White steamers were in waiting at 59th street and Fifth avenue. When the procession reached this point Col. Roosevelt, accompanied by Collector Loeb and Cornelius Vanderbilt, transferred from his carriage to one of these Whites, and then joined his family at Mr. Robinson's house. Mayor Gaynor and one or two other members of the reception committee followed Col. Roosevelt in the other White.

After luncheon at Mr. Robinson's house the entire party, including Col. Roosevelt, again entered the White cars, and were driven over to Long Island City, where they embarked on a special train for the ex-President's home at Oyster Bay.

On Sunday White cars were again in evidence in service. Col. Roosevelt, in accordance with the custom which he followed for the last two years of his term as President, drove to church in a White steamer. In the meantime a party of some forty of the more prominent Rough Riders were taken in the White gasoline truck to a clam bake at the Travers Island Club House of the New York Athletic Club.

Incidentally, it is stated, apparently with the color of authority, that Mr. Roosevelt

to the interpretation of the new measure, the police are given a certain amount of judiciary power, since it is required to blow the horn only at corners where the view of intersecting ways is obstructed.

Other provisions brought into effect by the sheaf of bills which dragged through the length of the recent session of the legislature are the reciprocal clause governing the admission without local license of non-resident motorists; one fixing a definite position for the license number plate; one which releases chauffeurs from the obligation of wearing the badges of their calling, and an amendment to the speed law. This provides that the maximum speed of eight miles an hour formerly required at all street intersections and curves hereafter shall apply only where the view of the road is obstructed. The clause providing that in thickly settled portions of cities and towns no "bell, horn or other device for signalling shall be sounded so as to make a harsh, objectionable or unreasonable noise," also provides against the emission of smoke and the use of the muffler cut-out in such localities. As no definite rule is laid down as to what constitutes a "harsh, objectionable or unreasonable noise," it would appear that the motorists will be thrown on the mercy of the police.

**MONTAUK AWARDS ARE ANNOUNCED**

**Sixteen Contestants in Long Island Event Receive Perfect Scores—What Happened to the 22 Unfortunates.**

Accompanied by the announcement of his farewell as a promoter, W. J. Morgan of New York on Saturday, 18th, issued the results of his Motor Contest Association's two days' "Tour of Long Island Hotels," otherwise styled the "Montauk Light or Bust" contest, which occurred on the 14th-15th inst. Of the 38 contestants in the 350 miles run, 16 came through with perfect scores, as follows:

Division 1A—For cars selling for \$800 and under.—Elmer D. Cutting, Hupmobile.

Division 2A—For cars selling from \$801 to \$1,200.—D. M. Hasbrouck, Mitchell; W. B. Young, Ford; Charles Jones, Buick.

Division 3A—For cars selling from \$1,201 to \$1,600.—William Simonson, Mitchell; E. A. Taylor, E-M-F.; C. S. Cheney, Staver.

Division 4A—For cars selling from \$1,601 to \$2,000.—Dr. William F. Nafis, Buick; W. Davenport, Buick; Philip Hines, Buick.

Division 5A—For cars selling for \$2,001 to \$3,000.—W. E. Shuttleworth, Haynes.

Division 6A—For cars selling from \$3,001 to \$4,000.—C. V. Searing, Welch-Detroit; Fred J. Titus, Palmer-Singer; Paul Harvey, Franklin; Neil Whalen, Matheson.

Division 7A—For cars selling for \$4,001 and over.—Harold W. Sisco, Amplex.

The remaining 22 contestants, who were penalized and the reasons therefor, are as follows:

Division 1A—R. E. Gillam, Hupmobile, motor stop, 1; replenishments, 9; withdrew, 1,010 points.

Division 2A—A. J. McCormick, Jr., Ford, replacing balls in bearings, 38 points.

Division 3A—George Ainslie, Regal, differential trouble, 1,000 points; E. Miles, Welch-Chalmers, stalled motor and stuck in mud, 118 points.

Division 4A—W. A. Wells, Pierce-Racine, withdrew second day, 1,000 points; Herbert F. Earl, Auburn, broken axle, 1,000 points; John L. Gwyer, Jr., Elmore, gear box adjustments, 40; motor stop, 2; replenishments, 6; withdrew, 1,048 points; Thomas Wilson, Westcott, motor stop, 1; late, 78 minutes, 79 points; Frank Remsen, Buick, 8 minutes late, 8 points.

Division 5A—Joseph Trehour, Mercer, failed to check in at noon control, 1,000 points; C. J. Hichman, Franklin, magneto trouble, withdrew, 1,000 points; Richard Carter, Selden, cut fan belt, 1; water replenishment, 3; 4 points; O. R. De Lamater, Mitchell, clutch adjustments, 2; water replenishment, 3; cleaning lubricator belt, 4; 9 points.

Division 6A—A. P. Palmer, Palmer-Singer, replenishments, 6; 122½ minutes late,

129 points; A. M. Henderson, Palmer-Singer, stalled motor twice, 2; late 178 minutes, 180 points; H. K. Sutherland, Knox, adjustments and replacing spark plugs, 15 points; Arthur Coombs, C. G. V., motor stop, 1; repairs on engine, 47; late 309 minutes, 357 points.

Division 7A—V. P. Pisani, Züst, removing carbon from igniters, 30 points; Walter Jones, Amplex, failed to check in at first control, 1,000 points; Peter Smith, Fiat, withdrew owing to accident, 1,000 points; Earl A. Cryne, American, replacing spark plugs, 34; withdrew on account of fire, 1,034 points.

The award for L. R. Burne, who drove a Cadillac in Division 4A, has been held up for the present.

**Ten Clubs Hold Elections of Officers.**

Geneva (N. Y.) Automobile Club—President, F. A. Herendeen; secretary, Charles W. Fairfax; treasurer, E. S. Siglar.

Automobile Club of Troy, N. Y.—President, Charles C. Kelly; vice-president, Frank Gilbert; secretary, Alonzo McConibe.

Detroit (Mich.) Automobile Club—President, Frank H. Welden; vice-president, Arthur Pack; secretary, Sherman L. Depew; treasurer, Cullen Brown.

Alcester (S. D.) Automobile Association—President, A. E. Ofstad; vice-president, Eric Nelson; secretary, Charles J. Peterson; treasurer, G. A. Lindgren.

Owego (N. Y.) Automobile Club—President, James S. Truman; vice-president, John M. Parker; secretary, William G. Ellis; treasurer, George Truman.

New Britain (Conn.) Automobile Club—President, M. S. Hart; vice-president, John B. Minor and L. B. Mallory; secretary, Philip Corbin, Jr.; treasurer, E. W. Abbe.

Woodford County (Ky.) Automobile Club—President, W. H. Edwards, Jr.; vice-presidents, Dr. S. A. Blackburn and Isaac W. Parrish; secretary, Dr. S. M. Steadman; treasurer, R. N. Judson.

Nashville (Tenn.) Automobile Club—President, H. F. Smith; secretary, A. S. Warren, Jr. Directors: J. O. Cheek, Leland Hume, J. H. Baird, Robert Rhea, James Palmer, Dr. O. West, W. Kirkland, J. W. Love, W. R. Cole and M. S. Lebeck.

Automobile Club of St. Louis (Mo.)—President, Sam D. Capen; vice-president, Roy F. Britton; secretary, Samuel Plant. Directors: Ephron Catlin, Jr., J. Howard Holmes, James Hagerman, Jr., W. J. Lemp, Jr., Alden H. Little and George J. Tansey.

New Jersey Automobile and Motor Club—President, Clarence H. Bissell; vice-president, H. D. Bowman; treasurer, George H. Simonds; secretary, A. B. LeMassena. Directors: W. C. Crosby, Guido O. Groebe, Dr. F. B. Meeker, J. B. Scarlett and Lewis Strauss.

**HOW CALCIUM CARBIDE IS MADE**

**Enormous Electrical Heat is Employed—Phenomena of its Formation and of its Action with Water.**

Considering its great prevalence and cheapness, it is somewhat difficult to realize that only a relatively short time ago calcium carbide was an article too costly for commercial use; though its valuable properties were thoroughly appreciated, it was considered beyond the limits of everyday application. For its reduction to its present realm of great and growing usefulness credit is due the electric furnace, to which modern industrialism is so deeply indebted. During the sixteen years since it first became a marketable commodity, its application has advanced rapidly and still is widening.

"Calcium carbide is a strong compound of calcium and carbon, which is decomposed into lime and acetylene gas by the action of water," explains L. L. Barnes in the "Co-Operator." "It is made from coke and burnt lime generally in electric furnaces where large currents and low voltages are used and extremely heavy bus-bars are necessary. Currents as high as 40,000 amperes at 30 volts have been used. The current comes almost invariably from transformers, and, as the resistance of the charge varies rapidly with the temperature, some means of regulation is necessary. This is usually accomplished either by means of an induction regulator or by varying the transformer ratio by means of a dial switch or contactors.

"At the temperature of formation calcium carbide is liquid. As the actual formation of carbide occurs in the neighborhood of 3,000 degrees centigrade, all the ordinary refractory linings are unsuitable for its manufacture, and a frozen layer of the carbide itself is used for the furnace lining, the exterior of the furnace being air-cooled, although in Europe there are some water jacketed furnaces used.

"The principal use of calcium carbide at present is for the manufacture of acetylene gas, which is used for lighting and is beginning to be used for heating purposes on account of the very high temperature obtained when burning it with oxygen.

"Pure acetylene gas is credited with having a faint, sweet smell, but the smell given off by all carbide the writer has had the opportunity of examining has been quite the reverse of either faint or sweet. The unpleasant odor arising from the raw carbide upon opening the receptacle is the primary source of objection.

"Various methods have been applied to overcome this serious drawback in the way of coating the carbide and by counteract-

## THE MOTOR WORLD

### COUPE SEATS FOUR PASSENGERS

**White Discloses an Inside Driven Model with an Unusual Body—Novel Arrangement of the Interior.**

To provide for the needs of the motorist who prefers to drive his own car and yet desires an enclosed vehicle suitable for all-weather service, the White Co., Cleveland, O., just has brought out a new type of inside driven coupe which is a distinguished addition to its gasoline line. Differing from other inside driven closed cars in that it has seating capacity for four persons, the machine has all the grace of the limousine type with the additional exclusiveness which the driver-owner considers such a valuable asset.

WHITE INSIDE DRIVEN COUPE

In chassis formation the machine follows the standards of White gasoline construction. The body arrangements, besides being comfortable and attractive, display considerable ingenuity and originality in the method whereby entrance may be obtained from either side of the machine without inconvenience. With this object, the driver's seat is so made that it will fold up against the steering column. This affords ample room for the use of the door on the right side of the vehicle, and makes easy access to the commodious rear seat, which accommodates two persons. Beside the driver's seat is a comfortable seat for a third passenger, sufficient space being allowed for access to the interior through the left hand door if that be required. Rich upholstery, an electric dome light and other luxurious fittings such as commonly are found in limousine bodies, complete the appointment of the machine.

Like the two-passenger coupe, this vehicle is designed especially for those who desire ample protection against the elements together with comfortable riding quarters. It provides in addition the effect of an open car, when the windows are dropped into pockets in the wainscotting. It should be particularly serviceable for town use by physicians and ladies and for evening service in calling and theater attendance. The advantages of the two-passenger enclosed car are so well recognized that it would seem likely that the new type, with its

ing the smell by the application of strong sweet-smelling essences.

"Another feature in connection with the action of calcium carbide and water in the generation of acetylene is the amount of heat given off in the reaction. One pound of carbide, when brought into contact with water, gives off in its decomposition, 753 British thermal units which, in the absence of an excess of water, is sufficient to raise the temperature of the surrounding materials to a bright red heat.

"On this account, all apparatus for the generation of acetylene which is not provided with a sufficient water jacket to insure the dissipation of heat involved is liable to become heated to a dangerous point in case of too rapid a consumption of gas.

"To a certain extent calcium carbide resembles the electric storage battery, for while by present processes it requires the expenditure of from 2.0 to 2.3 horsepower hours to produce one pound of carbide, this may be conveyed to any distance, or stored for any length of time, if properly protected, and then the acetylene generated from it is capable of developing one horsepower for one hour if used for driving a gas engine."

#### Shoulders on the Sliding Joint.

In a shaft driven car which has seen considerable service it is well to examine the sliding joint in the propeller shaft to see whether an excessive amount of wear has taken place. If so, and if the result has been to cause a shoulder to form on the sliding member, this should be filed or ground down. Otherwise, in a case of excessive spring action, the striking of the shoulder against its bearing in the female member of the coupling will cause a very perceptible jolt to the chassis, which may lead to more serious consequences.

#### False Symptoms of Oil Excess.

Symptoms of excessive oil feed may result in a pressure circulating system when one or more engine bearings are worn to excess. In such a case, the looseness of the journal affords too great an outlet for the oil and permits partial flooding in its immediate vicinity. If such a condition exists, it may lead to the impression that the entire lubricating system is feeding too freely, and a new and false adjustment may be made accordingly.

#### Must Not Borrow Pierce Finery.

Bodies, lamps, fittings and hardware for Pierce-Arrow motor cars are not to be sold for use on other cars, according to the instructions which are being issued to dealers by the Pierce-Arrow Motor Car Co., of Buffalo, N. Y. The company has its own exclusive designs for these parts and considers them as much integral parts of the car design as the motor, transmission or rear axle.

extended capacity, should meet with immediate appreciation at the hands of the more discerning class of motorists.

#### Explains the Expanding Disc Clutch.

In adopting the Wells expanding disc clutch, the Model Gas Engine Works, Peru, Ind., has brought out a special bulletin explaining the construction of the device very thoroughly and listing the principal specifications of the three sizes which are being produced. The principle of the device, which was described in these columns in its application to the Sterling car, consists in the expansion of a group of four segments, which form a double conical surface, into a conical recess formed between two concave discs. Expanding the segmental wedges, has the effect of spreading the discs apart and so engaging the ends of the clutch housing frictionally. The device is extremely compact and is said to be remarkably smooth working. It forms a somewhat radical addition to the line of components, including motors and transmissions, which the Model company already is producing.

#### Reviewing Timken Bearing Progress.

As a mark of confidence in roller bearing theory, as translated in the product of the Timken Roller Bearing Co., Canton, O., nearly a hundred motor car manufacturers in this country now are using Timken shaft mountings. Of this market, which naturally represents a huge outlay of manufactured material, 67 customers are builders of gasoline pleasure cars, 30, or thereabouts, of commercial vehicles; and a half dozen are makers of electrics. The complete list is published as an appendix to a new brochure, which the Timken bearing company just has issued, and which deals with the growth, refinement and scope of this business—three impressive factors. The booklet is profusely illustrated with pictures which show Timken bearings in the making, and in themselves tell a graphic story of clean and exact workmanship.

#### Warning Against "Fake" Parts.

Warnings are being issued by the Connecticut Telephone & Electric Co., of Meriden, Conn., concerning imitation parts for Connecticut coils. These, when used for replacement purposes, often cause the coils to act badly, and their use invalidates any guarantees made concerning the coils by the manufacturers. In order to protect purchasers against bogus parts, the genuine Connecticut parts hereafter will bear the company's name. It is pointed out these parts are registered, and that the manufacture or sale of imitations is an offense in some states punishable by heavy fine and imprisonment, together with confiscation of the imitations. The company indicates its intention of pursuing a policy of vigorous prosecution.

THE NEW  
**Rambler**

Rambler Fifty-four, 45 H. P., \$2250  
with Magneto, Lamps, Presto-Lite Tank and Tools.

*Workman applying micrometer  
gauge to Rambler large bevel  
gear to determine its absolute  
accuracy.*

The maximum variation permitted in any vital part of the Rambler is one-thousandth of an inch. In some instances the restriction is carried to the extent of ten-thousandths of an inch. Each part is inspected after each operation in the making and again inspected after each of the various stages of assembling. That is why Rambler quality is proved in every detail of the car.

## BUS EMBODIES ADVANCE IDEAS

**Composite of Radical Features in Daimler Vehicle—Duplicate Power Plants, no Chassis and Wire Wheels.**

About all that modern theory has produced in English automobile practice is combined in the new type Daimler "K. P. L." omnibus, which just has been brought out and which recently was given its trial trip in the vicinity of London. The mystic initials in the name refer to the group of patents which are combined in its construction and which are those of Knight, Pieper and Lanchester. As those familiar with British trade movements immediately will infer, the vehicle is driven by the Knight slide-valve engine and has a development of the Pieper form of electric transmission and worm drive. In addition, it is characterized by the use of an all-steel body, which replaces and eliminates the ordinary chassis frame; it runs on wire wheels of the Rudge-Whitworth type, and is equipped with front wheel brakes.

The product plainly results from an extremely radical attempt to amalgamate every available feature which recent scientific practice has brought about. But its existence finds ample justification in the noisy and cumbersome service 'busses in use on London's streets, which the new machine is intended to replace, should it prove trustworthy and efficient.

A remarkable feature of its construction is the use of duplicate power plants throughout, one being applied to the drive of each of the rear wheels. The motors are of the improved four-cylinder Knight-Daimler type, with sliding sleeve valves, and are of 33-16 by 47-16-inch bore, and stroke, roughly speaking. They are rated at 12 horsepower each, making the total nominal rating for the vehicle 24 horsepower.

The transmission mechanism consists of the so-called "dynamotors," which are six-pole, shunt wound machines, capable of being used either as dynamos or motors. Their official rating is 3 kilowatts capacity, but they are capable of sustaining very heavy overloads. An accumulator is mounted under the driver's seat, which serves to equalize the load and also furnishes one of the four means of retarding the vehicle by offering resistance to the dynamo-electric machines when they are coupled to act in the capacity of generators.

The power units are mounted, one on either side of the machine, in such a way that they may be dismantled and replaced without disturbing the body or any other portions of the vehicle. They drive directly to the rear wheels through short cardan shafts and worm transmission gears. So carefully have the means of assemblage

been worked out that it is claimed that the dismantling and replacement of one of the units complete may be effected in less than half an hour.

For purposes of speed control the flexibility of the electrical system is utilized to the utmost. Whenever the vehicle is brought to rest the engines are stopped, so that there is no vibration or noise when the car is not in motion—and an astonishingly small amount when it is, so it is claimed. In order to restart, current from the storage battery is brought into effect to start the gasoline engines simultaneously with the motors. In running, an excess of power over that required for vehicle propulsion goes to charge the battery, while the same reserve also is available for overcoming heavy grades. But two levers are used for ordinary running, and they are mounted on top of the steering column. One is connected to the throttle valves of the two engines, while the other is an electrical controller connected into the fields of the dynamotors.

The braking system is unusually complete. Of the four means of retardation alluded to, one is applied through the charging of the battery, and comes into effect automatically upon the manipulation of the controller handle into a certain position. In addition there are a magnetic braking system, which acts independently upon each of the propeller shafts, and a set of front wheel expanding brakes, which may be applied either by means of pedals, or a brake lever.

The body and frame combined is of sheet steel, suitably reinforced at points of heavy stress by means of cross girders riveted in place. The lower portion of the side members is rolled into deep channel section. To prevent weaving in the structure, due to cross strains, a large rectangular box girder is placed under the driver's seat, occupying part of the space, and which, incidentally, forms the gasoline tank.

The front wheels are formed with recessed hubs carrying centrally disposed steering pivots which are directly in line with the tire treads. They are 40 inches in diameter while the rear wheels are 48 inches. Despite this enormous wheel size, the floor level of the body interior is only 27 inches above the ground, which is from 5 to 10 inches lower than in the standard type of 'bus. The ground clearance is 12 inches.

The arrangement of the engine auxiliaries is unique. Ignition is accomplished by means of magnetos which are driven from the engine crank shafts. The jacket water from both engines is run through a common cooler in front, and the circulating pump, together with the radiator fan, is driven by a ½ horsepower electric motor, independent of the engines, which draws its energy from the accumulator.

Including 560 pounds of storage battery, the total unladen weight of the machine,

ready for the road is a trifle over 7,700 pounds. The body is of the double-deck type, similar to that of the standard 'bus. But its steering lock is much wider, and its wheel base is 10 feet 5 inches, as compared with the standard length of 14 feet.

### "Dragging" in Disc Clutches.

Multiple disc clutches which do not receive proper attention occasionally exhibit the peculiarity of "dragging" when the car first is started, but of working all right after some little distance has been covered. This difficulty, though rare, generally can be traced to the use of too heavy a lubricant in the clutch housing, or one which has been allowed to remain too long. When the oil is cold, it is so stiff as to cause the clutch to spin when an attempt is being made to change gears after a long period of rest. The effect of continued running, particularly if the clutch is slipped at all, is to generate sufficient heat to cause the oil to be thinned out, after which it gives better results. In any case, it is important that only clean oil, and that of the right consistency, be used on the clutch discs.

### Tension on Rear Axle Tie-Rods.

Whenever it becomes necessary to adjust the tension of the tie-rods which are employed on certain types of live rear axle, extreme care should be taken not to throw an excessive amount of load on the rods. If the turnbuckles are drawn too tight, the effect will be to throw a greater amount of strain on the rods than they are intended to bear, possibly tending to bow the axle upward very slightly as well. The result will be that the slender tension members will be called upon to bear the brunt of any shocks which the axle receives and will be very likely to yield without warning. In addition to this, there is some tendency that the working of the transmission parts within the housing may be interfered with as a result of disalignment.

### Cause for Lubrication Clogging.

When cleaning the strainer element in an automatic lubricating system, except in the case of a hasty roadside repair, it is well to clean out the oil reservoir and all piping as well. Otherwise, because of detritus in the oil, the clogging action may be repeated immediately. To keep the oiling system in good working condition is one of the most vital necessities in automobile maintenance.

### Marks on the Body Finish.

Garagemen and automobile repairers who will devise a system to prevent their shop operatives from leaving thumb-print autographs and knicks all over the finish of the carriagework will be on the high road to fame and fortune. Carelessness in handling the body and fenders is a most objectionable characteristic of work done in many establishments of this nature.

## RECENT PATENTS.

957,626. Driving Gear for Automobiles. Philip J. Rivers, New Rochelle, N. Y. Filed July 29, 1908. Serial No. 445,961.

1. In a vehicle driving mechanism, the combination with a frame, of a forward and a rear axle mounted thereon, a sleeve forming a journal for the forward axle, a wheel pivotally held to each end of the sleeve, means for moving the wheels horizontally on their pivots in unison, a gear carried by each wheel, a second gear slidably held on each end of the forward axle, intermediate gears connecting the gears on the ends of the forward axle to operate the gears of the wheels in whatever position they are placed by the steering mechanism, levers for moving the gears on the axle inwardly or outwardly, a rod connecting the levers, a hand lever, and means connecting the hand lever to one of the gear operating levers whereby the sliding gears may be operated so that the forward wheels may or may not be positively driven.

957,653. Oil-Proof Spark Plug. Eli J. Bushey, New York, N. Y. Filed March 10, 1909. Serial No. 482,471.

1. A spark plug provided with a shell having an exterior retaining flange at its terminal, and a firing cap forming with the said shell a spark gap, the said cap having a deflecting flange at the said gap.

957,713. Circuit Closer or Timer. William J. Rapp, Detroit, Mich., assignor to H. H. Creighton and Alexander Arnold, Toledo, Ohio. Filed Jan. 27, 1908. Serial No. 412,726.

1. An electrical instrument for the purpose described comprising a battery, an induction coil, a cylinder of insulating material, triple circular circumferentially arranged rows of insulated electrical contact devices carried within the cylinder and extending therethrough, a shaft rotatable within the cylinder provided with plural correspondingly arranged electrical contact devices to form electrical connection with the two outer rows of contact devices of the cylinder, and with an intermediate electrical contact device in electrical circuit with the shaft, and with the intermediate row of the contact devices of the cylinder, the contact device in circuit with the shaft arranged to be in electrical circuit with the battery through the shaft, and to be connected with leads to the coil, one of the outer rows of the contact devices of the cylinder arranged to be in electrical circuit with the coil, and the other outer row of contact devices of the cylinder arranged to be in electrical contact with independent spark plug leads, the contact device in circuit with the spark plug leads being insulated from said shaft.

957,727. Speedometer. Dillwyn M. Bell, Oak Park, Ill., assignor to William J. Anderson and George F. Lewis, Chicago, Ill. Filed Nov. 1, 1909. Serial No. 525,613.

1. In a device for indicating the speed of rotation of a wheel or other rotating object, the combination with a rotary magnet, of means whereby said magnet is driven from said rotating object, a magnet armature rotatably mounted in the field of said magnet and driven thereby, means whereby said armature is prevented from exceeding a predetermined speed, indicating means, variable speed mechanism driven at a speed proportionate to the speed of said rotating object, and means responsive to the resultant action of said armature and said

variable speed mechanism for actuating said indicating means.

• 957,731. Carburetter. Francis W. Brady, New York, N. Y. Filed Sept. 19, 1907. Serial No. 393,714.

1. A carburetter comprising a carburetter chamber and a vaporizing member rotatably mounted therein, said chamber having an air inlet port above the vaporizing member, in combination with means for feeding a stream of oil on the upper surface of the vaporizing member, and mechanism for rotating said member to spread the oil thereon in a thin film, whereby the air is caused to pass directly across the film of oil on the vaporizing surface; substantially as described.

958,023. Incased Universal Joint. Clarence W. Spicer, Plainfield, N. J. Filed Jan. 17, 1907. Serial No. 352,785.

1. The combination with an incased universal joint structure, comprising driving and driven members, means connecting said members for the transmission of the motion from one to another, and a casing inclosing said driving and driven members, having an opening through which one of said members projects, such opening substantially closed by the member so projecting therethrough, of a cover for said opening outside of said casing but coacting therewith, and mounted upon the member so projecting through said opening.

958,025. Liquid Fuel Tank. Joseph A. Steinmetz, Philadelphia, Pa. Filed Oct. 16, 1909. Serial No. 522,928.

1. A tank containing a partition forming two compartments, valve mechanism disposed near the bottom of said partition for controlling communication therethrough between said compartments, an outlet for discharging from the bottom of one of said compartments and an inlet through the top of said tank over said partition for charging both of said compartments simultaneously.

958,053. Tire Protector. John Wilmes, Maquoketa, Iowa. Filed Sept. 20, 1909. Serial No. 518,588.

A protecting device for tires comprising a series of concaved segmental plates having longitudinal flanges at the edges thereof which are apertured, the outer surface of each of said plates having a centrally disposed rib with recesses therein, sockets formed upon the outer surface of each plate adjacent to its end, lugs upon the adjacent end of the plate and projecting beyond its end, said sockets of one plate adapted to receive the lug upon an adjacent plate, bail-shaped wires engaging the recesses in said rib and passing through the apertures in said flanges and having eyes at their ends, a cable passing through said eyes and adapted to hold the plate together and over a tire, as shown and described.

958,128. Carburetter. Albert Howarth, Providence, R. I., assignor, by mesne assignments, to Star Carburetor and Supply Company, Providence, R. I., a Corporation of Rhode Island. Filed Sept. 28, 1908. Serial No. 455,194.

1. In a carburetter for an engine, the combination of a carburetter case; a shaft mounted transversely in the case and capable of oscillatory movement; means for oscillating said shaft at will to limited extents; a fixed air inlet tube opening into the carburetter case and extending from said case in an axial direction, which air inlet tube has ports through the sides thereof.

located and arranged to deliver atmospheric air into the carburetter case; an outlet pipe communicating with the interior of the carburetter case and extending therefrom to the engine; a gasoline-supply pipe extending in the axial line of the carburetter case and of the air inlet tube and discharging into the air inlet tube; a tubular valve fitting slidably in the air inlet tube and adapted alternately to cover or uncover the ports of said tube and having at its top a disk provided with a central aperture for the passage therethrough of said gasoline-supply tube, which disk has the same diameter as the tubular body of the valve and is adapted to be moved with said valve by the suction of the engine, said tubular body being provided with side openings adjacent to but beneath the disk, which openings are covered by the air inlet tube when the tubular body of said valve is wholly contained in the air inlet tube in contact therewith, but are open to the interior of the carburetter case when the valve has been moved up beyond the top of the air inlet tube by the suction of the engine; and a curved arm mounted fast at its inner end on the shaft and in contact at its outer end with the disk and adapted to move the tubular body of the valve into the air inlet tube and also to limit the extent of the upward movement of the tubular body of the valve when said valve is subjected to the suction of the engine.

958,132. Fender for Automobiles. Robert Jardine, Cleveland, Ohio. Filed Nov. 7, 1906. Serial No. 342,315.

1. A fender for a vehicle wheel comprising a cylindrical section disposed to conform with the periphery of such wheel and disposed to cover the upper portion of the same, a section continuous with the inner edge of said first-named section and disposed to inclose the inner side of such wheel portion, and a flange or rib along the forward and outer edge on the underside of said first-named section, said section being so disposed and with width of said rib being so gaged as to place the latter without the periphery of the wheel altogether.

958,147. Friction Clutch. Karl Matthias, Dessau, Germany. Filed Oct. 6, 1909. Serial No. 521,410.

1. A friction clutch, comprising two clutch halves, a pair of closed rings between the same, elastic means between said rings and one of said clutch halves, said ring and elastic means rendering the clutch halves capable of yielding tangentially, axially and perpendicularly relative to one another, and mechanism for bringing the said rings into and out of frictional engagement with the other clutch half.

958,183. Automobile Covering. Albin Schreiber and Otto Meister, Untermhaus, near Gera, Germany. Filed May 5, 1909. Serial No. 494,061.

An automobile hood, comprising a main hoop, an articulated outrigger hoop pivoted thereto and having stop-hinges intermediate its inner and outer members, a covering secured at its front end to the top of the outer member, braces connecting said outer member with the main hoop, and an auxiliary hoop pivoted to said braces intermediate the outrigger hoop and main hoop and supporting the covering back of the outrigger hoop.

958,212. Transmission Apparatus. Jacob A. Baab, New York, N. Y., assignor of one-half to Daniel Rohrer, New York, N. Y. Filed Aug. 28, 1908. Serial No. 450,706.

1. An apparatus of the kind described, comprising a pump, a primary motor operating the pump, a secondary motor detachably coupled on its driving shaft or axle, and a system of circulation pipes connecting the secondary motor and the pump.

958,242. Automobile Transmission Gear-ing. Walter C. Falk, Bluffton, Ind. Filed Feb. 3, 1910. Serial No. 541,741.

1. In a motor vehicle, the combination of a main frame, an engine mounted upon the main frame, an axle journaled upon the main frame, means for transmitting power from the engine to the axle, a casing carried by the main frame adjacent each end of the axle, a vertical shaft loosely mounted upon each of the said casings, the said vertical shafts being provided with horizontally disposed bearings, a yoke fitted to each of the vertical shafts so as to rotate therewith and formed with a bearing arranged in alinement with the bearing of the said vertical shaft, stub axles journaled within the bearings of the yokes and vertical shafts, wheels rigid with the stub axles, means for transmitting motion from the before mentioned axle to the stub axles, and means for turning the vertical shafts to swing the wheels about a vertical axis.

958,350. Vehicle Wheel. Con D. Anderson, Lima, Ohio. Filed March 30, 1906. Serial No. 308,859.

1. In a device as described, an axle, a wheel having a ball-and-socket connection therewith, and a member consisting of four arms integrally formed thereon supported on said axle and engaging said wheel at diametrically opposite points, two of said arms being slotted to permit it to be moved with respect to said axle in a horizontal plane, substantially as specified.

958,445. Starting Device for Vapor Apparatus. Percy H. Thomas, East Orange, N. J., assignor to Cooper Hewitt Electric Company, New York, N. Y., a Corporation of New York. Filed May 9, 1904. Serial No. 207,014.

1. The method of starting a vapor electric apparatus comprising a hermetically sealed and completely exhausted container, an anode and a vaporizable reconstructing cathode therein, which consists in overcoming the negative electrode starting reluctance separately from the vapor path starting resistance, storing energy externally and utilizing a portion of this stored energy to overcome the vapor starting resistance through the partial interposition of negative electrode starting reluctance within the apparatus.

958,476. Carburetter. George E. Cook, New York, N. Y., assignor of one-half to Philip Schlosser, New York, N. Y. Filed June 18, 1909. Serial No. 439,107.

1. A carburetter having a plurality of mixing chambers, each having an air inlet and a spray nozzle, an auxiliary air inlet for one only of said mixing chambers, means for automatically controlling said auxiliary air inlet, and a throttle valve for controlling said mixing chambers, said throttle valve when in its closed position, permitting a limited flow through one of said chambers and serving to bring all of said chambers into operation and simultaneously varying the flow through all of them upon an opening movement.

958,501. Motor Vehicle. Frank H. Johnson, Faribault, Minn. Filed March 11, 1909. Serial No. 482,753.

A motor vehicle comprising upper and lower main frame members, a front transverse frame, of open form, interposed between and pivoted to said frame members, a shaft journaled in the end portions of said transverse frame, ground wheels on said shaft, a sprocket gear surrounding the shaft, a universal joint interposed between the shaft and said gear, a sprocket belt extending around said gear and rearwardly from the same.

958,909. Vibrator for Induction Coils. Burton L. Lawton, Meriden, Conn., assignor to The Connecticut Telephone & Electric Company, Incorporated, Meriden, Conn., a Corporation of Connecticut. Filed Nov. 25, 1908. Serial No. 464,372.

1. In a vibrator for induction coils, a vibrator element having a fixed contact point, a bridge having a flexible arch, said bridge being mounted at opposite sides of said vibrator element but independent thereof and overstanding the same, a contact point fixedly carried by the arch of said bridge and overstanding the contact point on the vibrator and an adjusting mechanism above the arch of said bridge for adjusting the contact point carried thereby toward and from the vibrator contact point.

958,510. Shock Absorber for Vehicles. Thomas Lea, New Brunswick, N. J. Filed Dec. 8, 1909. Serial No. 531,966.

1. A shock absorber for vehicles com-

# KLINE KAR

Regardless of Price

or with the

Strictest Regard For Price

Model 6-40, 6 Cylinder Motor

Model 6-40, 6 Cylinder Touring

Model 4-24, Toy Tonneau

the Kline-Kar is unequalled. A strong statement but the Kline-Kar justifies it. Not only in its proved efficiency but in design, appearance and all the requirements that appeal to the discriminating motorist the Kline-Kar is in a class by itself. Its price is the only cheap thing about it.

Our 1911 line will be a winner. Now is the time to write us concerning it.

prising a pivot bolt, two plates having loosely engaging hubs mounted on the pivot bolt and providing a casing; one plate being formed with an offset, a ratchet wheel mounted on the hubs between the plates, a lever secured to one plate, a lever secured to the other plate and the ratchet wheel, a pawl ring carrying spring pawls and surrounding the ratchet wheel, a friction ring located between the casing and the pawl ring and having ears projecting into the offset, and a screw bolt working through the offset and bearing against an ear of the friction ring for controlling the frictional contact between the pawl ring and the friction ring.

958,544. Spring Arrangement for Vehicles. Julius Rosemeyer, Berlin, Germany. Filed Oct. 23, 1908. Serial No. 459,196.

1. A spring for vehicles comprising an upper and a lower leaf spring, said springs being independent of each other, a vertical two armed lever pivoted to the vehicle body, and means for securing one of the ends of each spring to said two-armed lever, substantially as described.

958,908. Timer and Distributer. Charles Cuno, Meriden, Conn., assignor to The Connecticut Telephone & Electric Company, Incorporated, Meriden, Conn., a Corporation of Connecticut. Filed Dec. 21, 1907. Serial No. 407,515.

1. In a timer and distributor, a shaft, a case having a bearing thereon, timer segments and distributor segments carried by said case, a timer contact and distributor arm carried by said shaft, means for insulating said sets of segments from each other, a cover for said case, secondary terminals carried by but insulated from said cover, said terminals making operative connection with said distributor segments.

## ON INLAND SEAS YOUR VACATION TRIP

THE COAST LINE  
TO  
MACKINAC

Detroit & Cleveland Nav. Co.

ALL the important ports on the Great Lakes reached regularly by the excellent service of the D. & C. Lake Lines. The ten large steamers of the fleet are of modern steel construction, propelled by powerful engines, and have all the qualities of speed, safety and comfort. The United Wireless Telegraph Service used aboard.

The D. & C. Lake Lines operate daily service between Detroit and Buffalo, Detroit and Cleveland, four trips per week between Toledo, Detroit, Mackinac Island and way ports, and two trips per week between Detroit, Bay City, Saginaw and way ports. About June 25, a special steamer will leave Cleveland twice a week direct for Mackinac, stopping only at Detroit every trip and Goderich, Ont., every other trip. Send two-cent stamp for illustrated pamphlet and Great Lakes map.

Rail tickets available on steamers.

# Kelly-Springfield Tires

Made by the Makers of the famous Kelly-Springfield solid tire

## DEALERS' TIRE MARGINS TRIMMED

**Unexpected Form for the Expected Rise in Tire Prices—Kasner Asks the Federal Government to Interfere.**

Predictions relating to further increases in tire prices on July 1, which have been causing dealers and tire branches to be swamped with messenger, mail, telephone, telegraph and personal visit orders from owners during the past 10 days, appear to have actual justification in what looks like a general raise of about 20 per cent. on the part of the principal tire makers. By far the most portentous feature of the increase is the fact that it signifies, in many instances, a reduction of the dealers' discount or margin, and carries into effect the frequent threat that since retailers who handle tires are accepting less profit than that provided for them by the old discounts, the discounts will be made to approximate the margin they do business on when they cut prices.

On some lines the new discount figures are said to provide for only 9 per cent. for small dealers and 14 per cent. for large quantity buyers. This permits the manufacturers to get more for their tires without greatly advancing the list prices to owners. In fact, it is suggested that they are killing two birds with one stone, in being able to claim that they are as considerate of the owner as possible, by only boosting list prices a little, and in readjusting the trade discounts.

Naturally enough, the raise is ascribed to the continued high price of rubber, and to the further fact that the tire makers are "holding off" and refusing to buy rubber at present, rather than go into the market and raise prices on the crude material still further by heavy purchases.

One of the new phases to the tire "situation" is an effort of A. H. Kasner, of New York City, a Chambers street dealer in low price tires, to interest the Depart-

ment of Justice in Washington, in a prosecution of what he describes as a conspiracy of the tire companies in "blacklisting" himself and other dealers, refusing to sell them tires. He claims that the tire companies act together in maintaining a "blacklist," whereby a dealer is prevented from buying tires from any of the companies in the agreement if he has a dispute with one of them. He has asked, therefore, that the Federal Government interfere.

### Jewel Encounters Financial Stringency.

Receivers have been appointed for the Jewel Carriage Co., of Cincinnati, O., on application of Albert E. Schaefer, a stockholder. It is claimed that the company, which makes the Ohio car and controls the Ohio Motor Car Co., is embarrassed because of delay in receiving raw materials and that various creditors are pressing it rather hard. The assets are stated to exceed the liabilities by as much as \$200,000. Judge Cushing on the 24th inst. named Charles F. Pratt and O. M. Bake as receivers, Pratt being president of the concern and Bake a stockholder.

### Mathews Family Buys All of Jackson.

George A. Mathews, the active head of the Jackson Automobile Co., of Jackson, Mich., has purchased the entire interest of Charles Lewis, the company's president, and of F. L. Holmes, making Mathews and his three sons the sole owners, although Holmes will remain with the company. In resigning the presidency and retiring from the company, Lewis has bought the Mathews' interests in the Clark Motor Co. and in the Lewis Spring and Axle Co. Lewis sailed this week for a European trip, accompanied by his family.

### Welch Acquired by General Motors.

Although the Welch Motor Car Co., of Pontiac, Mich., has figured as a General Motors "constituent" for the past year, the sale of the plant to the "merger" was announced only this week. Formal transfer is indicated as having taken place on Monday, 27th inst.

## BANKERS' BOYCOTT A BOOMERANG

**Attempt of Country Bankers to "Do Up" Automobile Dealers Brings Penalty—Causes Withdrawal of Deposits.**

In trying to put a damper on the enthusiasm for automobile buying in the western states, bankers in Kansas City, St. Louis, Chicago and the smaller towns have thrown what now appears to be a boomerang and which is giving them a scare that is calculated to make them extremely cautious in the future about attempting to prevent farmers and others from buying motor cars or anything else that they like. Their effort to prevent the flow of money toward automobiles has resulted in their being "hoist with their own petard" and in the bringing about of a condition that they by no means anticipated.

It has been apparent for some time that a number of western and southwestern bankers have united in taking steps to discourage their customers from buying motor cars, the reason being that the bankers resent the heavy movement of money out of their coffers to those of the automobile agents and manufacturers. But it transpires that their campaign, instead of reducing the outgo of cash from their vaults, has brought about a rush of cash withdrawals that is alarming.

The situation is indicated as amounting to a panic under the surface, becoming quite acute during the last few weeks. This condition is expected to be manifest in actual figures in the next statement of reserve banks in St. Louis, Chicago and Kansas City, in the way of greatly reduced country deposits. According to a Kansas City banker, it is largely the result of the attempt of the country bankers to "do up" the automobile dealers, and the bankers would seem to have come out "second best."

Following resolutions which various groups of the country bankers adopted at gatherings called for the purpose, a num-

ber of the banks began not only to refuse loans to motor car dealers but to dissuade farmers from buying machines, when they came to draw their money for the purpose. Those who wanted loans to buy cars were refused on the plea that money was tight. The banks were so highly successful in creating an uneasy feeling that farmers and small merchants, taking the scare quite seriously, began to withdraw their deposits, as being safer at home than in the banks. The effect has been to punish the banks severely for their interference, as is made evident by the statement that one Kansas City bank has had a sudden slump of over \$2,000,000 in its country bank deposits, a proof of the depletion of cash that the small banks are suffering in consequence of their "automobile boycott."

The attitude of the bankers is that too much money is being spent for automobiles, their statisticians having prepared figures to show that in Kansas alone over \$32,000,000 has been invested in machines during the last twelve months, while Graham G. Lacey, a banker of St. Joseph, Mo., as the result of inquiries to a list of 600 small banks in Kansas, Nebraska, Missouri and Iowa, is quoted as saying that he has obtained figures from 427 of them, showing a total of more than \$15,000,000 recently withdrawn for automobile purchase.

#### **Ford to Have Eastern Assembling Plant.**

The erection of an eastern assembling plant and storehouse for the Ford Motor Co., of Detroit, Mich., on the property in Long Island City which the company recently bought from the Long Island Railroad, is provided for in building plans which the Ford company has filed with the building bureau of the Borough of Queens, New York City. The site is at Jackson avenue and Hunnewell street, adjoining the big Sunnyside freight yards of the Pennsylvania railroad, across the East River from Manhattan. The plans call for a building of brick and steel construction, 225x70 feet, three stories high, and to cost \$80,000. Work is to be commenced within two weeks.

#### **Chicago Show Blanks in Preparation.**

Application blanks for the 1911 Chicago automobile show are being promised for circulation about the first of September by Manager S. A. Miles, of the National Association of Automobile Manufacturers, 7 East 42nd street, New York City. It is indicated that so far as the manufacturers of pleasure vehicles are concerned there will be no important change over the old plans for shows at Chicago. The show will, as heretofore, be open to all manufacturers, subject to the rule which gives members of the N. A. A. M. the first choice of space. Commercial vehicles will be given the right of way during the second week, but an effort will be made to provide space for any manufacturer of pleasure cars who may be

unable to exhibit during the first week. The old rule, which prevents the admission to the Chicago show of any manufacturer who participates in any unsanctioned show, will continue in force. The first week's show will open January 26 and close February 4. The second week will commence February 6 and end February 11.

#### **New York Has not Ordered Fire Engines.**

Despite the widely published news announcing the letting of contracts and giving of orders for automobile fire engines to be used in New York City, the local fire department is no nearer to having an automobile fire equipment than previously was the case. When a Motor World man called at fire headquarters, 157 East 67th street, Commissioner Waldo was out of town, but Chief Edward F. Croker stated that not only had no contracts been let or machine or machines been ordered, but that the whole thing as yet was nothing but talk. He said that although the matter of equipping New York City with automobile engines had been discussed frequently of late, it was by no means definitely settled. Beyond making this statement, the chief, in the absence of the commissioner, declined to commit himself in any way.

#### **American Makers in Canadian Association.**

Manufacturers of automobiles in Canada, including the branch factories established by American companies, have organized as a department or branch of the Canadian Manufacturers' Association, for the promotion of the automobile industry in Canada and for common cause in matters arising in connection therewith. The present members of the motor car branch are: Ford Motor Car Co., of Canada, Walkerville; Dominion Motors Co., Ltd., Walkerville; Regal Motor Car Co. of Canada, Walkerville, and the Kennedy Motor Car Co., of Preston. The executive committee consists of T. A. Russell, R. S. McLaughlin, R. B. Hamilton, Fred Sager and Hugh T. Tudhope.

#### **Body Plant for E-M-F. in Pontiac.**

The E-M-F. Co., of Detroit, Mich., has acquired a five acres tract of land in Pontiac, Mich., for another body factory. The site fronts on Grove, Baldwin and Howard streets, and adjoins that of the Monroe Mfg. Co., a body building concern in which the E-M-F. company has the controlling interest.

#### **Disagreement Leads to Receivership.**

A receiver has been appointed for the assets of Barthel, Daly & Miller, of New York City, importers of ball bearings, in a suit for a dissolution of the partnership brought by Christial Barthel and Edward F. Daly against Albert R. Miller. The litigation is the result of a disagreement among the partners. Judge Page, in the New York Supreme Court, appointed George

W. Mills, Jr., as receiver. The liabilities are said to be \$47,000 and the assets \$65,150. Although a dispute has arisen as to whether or not the firm retains the agency for Schafer ball bearings, of which it has been the importer, the receiver states that for the present the business will be conducted on its usual lines and that all contracts for Schafer bearings will be carried out without interruption.

#### **Palace Show Promoter Incorporates.**

The promoters of an "independent" or unlicensed show at Grand Central Palace, New York City, appear to have formed a corporation for the purposes of their project. Its incorporation under New York laws is under the name of the American Motor Car Manufacturers' Exhibit Co., a name which is calculated to sound very like that of the American Motor Car Manufacturers' Association, which in the past has been responsible for the Grand Central Palace shows, but which passed out of existence last February after nearly all of its members had taken out Selden licenses from the Association of Licensed Automobile Manufacturers. The directors include George C. LeComte, Fred C. Claessens and William A. Dunne, of Troy, N. Y. Last April it was announced by C. C. Conant, the active worker in the show enterprise, that the exhibition would be conducted by the Journal Co., of Troy, which publishes a carriage trade paper.

#### **Gramm Launches Texas \$1 Truck Project.**

B. A. Gramm, of the Gramm-Logan Motor Car Co., Bowling Green, O., and Z. Z. Brandon, of Toledo, are the moving spirits in a new motor truck company which is to be established in San Antonio, Tex., and which is to be known as the Commercial Motor Car Co. It is to be capitalized at \$100,000, with shares at \$1 each. A factory site has been secured on Nueva street, west of Flores street. The slate of officers is as follows: Z. Z. Brandon, president; B. A. Gramm, first vice-president; L. E. Lamb, of Bowling Green, O., second vice-president; F. J. Brandon, Toledo, O., secretary and treasurer; James L. Glass, of San Antonio, assistant secretary; L. J. and C. J. Le Comte, general sales managers.

#### **Kelsey Shows First Spartan Car.**

C. W. Kelsey, who organized the C. W. Kelsey Mfg. Co. in Hartford, Conn., for the manufacture of the Spartan car, is showing the first of the company's product. It is a four cylinder 30 horsepower model for \$1,000, equipped with a torpedo or "vestibule" body. The cylinders are 3 $\frac{3}{8}$ x4, cast in pairs, with valves on opposite sides of the head. The design provides for three point suspension of the motor and gear box unit. C. H. Kuhn, who, like Kelsey, previously was in the Maxwell-Briscoe organization, has joined him in the enterprise in an engineering capacity.

**ENGINEERS HAVE A FULL PROGRAM**

**Summer Meeting at Detroit Promises Good Entertainment for the Visitors—To Inspect Representative Factories.**

Designed to prove the "largest and most interesting meeting of the organization," the summer meeting of the Society of Automobile Engineers, which is to be held in Detroit, Mich., on July 28, 29 and 30, will be marked by an unusually comprehensive program. Visits to some eight or nine of the representative Detroit car and accessories plants have been planned, and in addition to the regular Society deliberations there will be a number of entertainment features.

The program for the sessions of the convention is as follows:

Thursday, July 28.—Morning—Business session. Afternoon—Reading and discussion of professional papers. Evening—Society dinner; reading and discussion of professional papers.

Friday, July 29.—Morning—Visits to manufacturing plants. Afternoon—Lunch on yacht; reading and discussion of professional papers. Evening—Visit to Light House Inn, participated in by ladies accompanying husbands attending convention.

Saturday, July 30.—Morning—Reading and discussion of professional papers.

Afternoon—Visit to New Michigan Central railroad tunnel.

The local Detroit committee for the meeting consists of Howard E. Coffin (ex-officio), H. W. Alden as chairman, George W. Dunham, Russell Huff, H. M. Leland, F. E. Watts, E. T. Birdsall, A. P. Brush, F. H. Floyd, G. M. Holley and G. E. Merryweather. The proposed list of Detroit factories to be visited includes Ghalmers, E-M-F., Packard, Cadillac, Timken-Detroit, Burroughs Adding Machine, Aluminum Castings, Gear Grinding and Detroit Steel Products.

**Salvador Amends Motor Car Duties.**

By a recent decision of the Treasury Department of Salvador, automobiles, both new and second-hand, are to be subject to a duty of 10 centavos per kilo, beginning with the first of July. This amounts, roughly, to 1.7 cents per pound. The method of collecting duty in Salvador is peculiar. Only 83 per cent. of the duty specified in the tariff is collected, of which 37 per cent. is payable in gold and the remaining 46 per cent. in silver. To this must be added a surtax of 6 pesos gold per 100 kilos, or about \$2.25 for every 220 pounds, and 30 per cent. of the aggregate amount of duty.

**Detroit Boat Makers Turn to Cars.**

For the purpose of manufacturing cars of a model to sell for \$1,000, Hugo Scherer and F. E. Wadsworth, president and secretary of the Michigan Steel Boat Works, of Detroit, Mich., have purchased a site at

Jefferson and Bellevue avenues, and are breaking ground for a three-story plant, 191 feet front, with wings 228 feet deep. The contracts call for the completion of the work in 90 days.

**Mechanical Experts Visit Rambler.**

Thinking to take a leaf or two from the book of the automobile makers, the Superintendent's and Foreman's Club, of Chicago, Ill., an organization of 85 managers of the greatest mechanical plants in the Middle West, recently visited the factory of Thomas B. Jeffery & Co., at Kenosha, Wis., to study the Rambler system of advanced physical and chemical tests. A special study was made of the methods in standardizing and making interchangeable the Rambler parts, and of the processes for treating and hardening metals, and considerable time was spent in the Rambler laboratory where so much labor is expended over uniform horsepower formula, chemical tests of materials and torsion tests of all parts that are subject to strains.

**Pope Gets an Export "Drawback."**

The Treasury Department, at Washington, D. C., has extended the "drawback" allowance on exported automobiles to cover the cars made by the Pope Mfg. Co., of Hartford, Conn. The allowance applies to the import duties on the Bosch magnetos and coils that are used.

**South Dakota Loses Its Spark Plug.**

The Ball Multi-Spark Plug Co., which has had its factory and headquarters in Aberdeen, S. D., has moved to Minneapolis, Minn. Offices and a factory have been taken at 917 Hennepin avenue, where Ball Multi-Spark plugs will be made and distributed.

**Denver Gas-Electric Gets Indiana Plant.**

The Universal Motor Co., which evolved a gasoline-electric truck in Denver Col., has received sufficient inducements from Newcastle, Ind., to establish its factory in the latter place. It has purchased the buildings and property of the Safety Shredder Co.

**Reynolds Moves Top Plant to Omaha.**

The E. W. Reynolds Mfg. Co., making automobile tops, has moved to Omaha, Neb., from Kansas City, Mo. The Omaha factory, which just has been completed for the company, is at 710-712 South 15th street.

**Dorian Rims to be Made in Brooklyn.**

The Dorian Remountable Rim Co., of New York City, making the Dorian remountable rim, has taken factory space in the Bush Terminal buildings in Brooklyn.

**Pope's First Dividend on Common.**

The Pope Mfg. Co., Hartford, Conn., has declared an additional dividend of 2½ per cent. on its common stock, payable June 30.

**PROGRESS TOWARD SELDEN DECREE**

**Licensed Meeting Brings Announcement of Date for Really Final Hearing—Makers Review Trade Conditions.**

Definite progress in the obtaining of the decree in the famous Selden cases against Ford and Panhard, in the United States Circuit Court for the Southern District of New York was reported at the meeting of the Association of Licensed Automobile Manufacturers in New York City on Tuesday, 28th inst. It developed that the final hearing on the interlocutory decree before Judge Hough has been fixed for the morning of July 19. The testimony on both sides in the supplemental bills and answers has been closed, and now awaits only the hearing of the application for the entry of the decree, the decision favorable to the Licensed interests having been rendered last September.

The meeting largely was given over to a discussion of trade conditions. According to an official announcement of the proceedings, it was shown that there is a continuance of the healthy demand for motor cars, and that a particularly strong demand for commercial vehicles is being felt.

"Reports and figures of the manufacturers," it is stated, "indicated very clearly the reason why bankers and railroad men have been decrying the buying and using of automobiles, as many people are buying motor cars now instead of putting their money into Wall Street with its usual uncertainty."

In addition to a meeting of the executive committee on Tuesday, there also was a meeting of the directors of the Association Patents Co., the patent division of the Licensed Association. Alfred Reeves, the general manager of the A. L. A. M., was elected secretary and treasurer of the Patents company, in the place of Coker F. Clarkson, who resigned recently upon becoming secretary of the Society of Automobile Engineers.

**Garage Equipment Building New Factory.**

The Garage Equipment Co., of Milwaukee, Wis., which manufactures an extensive line of motor car accessories, has purchased a site at South Pierce street and Eleventh avenue, on which a \$40,000 factory now is in process of erection. The plant is to be completed on or about the first of August.

**Detroiters Form Shock Absorber Company.**

Frank B. Hibbler and Maximilian K. Golden, of Detroit, Mich., have formed the Detroit Shock Absorber Co., to manufacture shock absorbing devices. The concern is capitalized at \$5,000, which sum later will be increased.

**The Week's Incorporations.**

Detroit, Mich.—Detroit Shock Absorber Co., under Michigan laws, with \$50,000 capital.

Detroit, Mich.—Hale Motor & Machine Co., under Michigan laws, with \$125,000 capital.

Milwaukee, Wis.—Door County Automobile Association, at Sturgeon Bay; no capital. Corporators—Joseph Wolter and seven others.

Fort Plain, N. Y.—H. B. Gray Co., under New York laws, with \$5,000 capital; to conduct automobile garage. Corporators—H. B. Gray, H. G. Gray, John C. Jackson.

Yonkers, N. Y.—Yonkers Garage Co., under New York laws, with \$3,000 capital; to maintain garages, etc. Corporators—H. R. Kimball, M. L. Weiss, W. Fairchild.

Utica, N. Y.—Gunn Motor Co., under New York laws, with \$300,000 capital; to manufacture and deal in motors, engines, etc. Corporators—J. K. Gunn, W. T. Baker, W. I. Taber.

St. Louis, Mo.—Percival Auto Repair Co., under Missouri laws, with \$20,000 capital; to conduct general garage business. Corporators—Geo. F. Percival, I. W. Percival, Houston Jones.

Birmingham, Ala.—Birmingham Motor Co., under Alabama laws, with \$5,000 capital; to deal in automobiles and automobile supplies. Corporators—Leo Loeb, J. H. Loveman, M. L. Lenk.

Chicago, Ill.—Monsen Auto Garage Co., under Illinois laws, with \$10,000 capital; to manufacture and deal in engines, vehicles, machinery, etc. Corporators—W. Brown, W. S. Hay, J. M. Wright.

New York City, N. Y.—North Side Coach and Auto Co., under New York laws, with \$150,000 capital; to maintain and operate an automobile livery stable. Corporators—J. J. Fox, W. J. Boyd, F. A. Orpp.

Cleveland, Ohio—Perfect Tire Co., under Ohio laws, with \$50,000 capital; to manufacture automobile tires. Corporators—M. J. Kirby, W. H. Enyon, W. C. Enyon, W. A. Moyer, F. L. Smith, J. Hopple.

New York City, N. Y.—American Stepney Co., under New York laws, with \$100,000 capital; to manufacture and deal in rims and wheels of all kinds. Corporators—L. W. Lissberger, J. Jacobs, W. H. Moser.

Camden, N. J.—Auto Motion Picture Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles and moving picture machines. Corporators—V. A. Murray, H. G. Elliott, J. R. Bradley.

Chicago, Ill.—Inland Motor Parts Co., under Illinois laws, with \$2,500 capital; to manufacture and deal in motors, motor vehicles, and accessories. Corporators—H. C. Carter, F. M. Lindgren, C. A. Garner.

Cleveland, Ohio—Auto Body and Top Co., under Ohio laws, with \$25,000 capital; to manufacture automobile tops. Corpo-

rators—G. W. Patterson, E. P. Dowling, C. C. Warden, G. F. Mallaby, S. S. Hammer.

Kenosha, Wis.—Thomas B. Jeffery Co., under Wisconsin laws, with \$3,000,000 capital; to take over the business of Thomas B. Jeffery & Co. Corporators—Kate E. Jeffery, Charles T. Jeffery, Harold W. Jeffery.

Selmer, Tenn.—Selmer-Savannah Auto Hack Line, under Tennessee laws, with \$10,000 capital, to do general livery and sales business in automobiles. Corporators—S. W. Gooch, H. P. Wood, C. C. Wright.

New York City, N. Y.—Peoples' Taxicab Co., under New York laws, with \$200,000 capital; to deal in, manufacture and operate motor cars and taxicabs. Corporators—J. M. Whitteman, E. I. Merry, T. H. Wilson, all of New York.

**Increases of Capital.**

Milwaukee, Wis.—Kamlee Co. increases capital from \$500 to \$15,000.

Chicago, Ill.—Armac Motor Co. increases capital from \$50,000 to \$75,000.

Pontiac, Mich.—Cartercar Co. increases capital from \$350,000 to \$650,000.

Detroit, Mich.—Motor Appliance Co. increases capital from \$25,000 to \$50,000.

Cleveland, Ohio—Auto Valve & Mfg. Co. increases capital from \$10,000 to \$25,000.

Dayton, Ohio—Cooley Motor Car Co. increases capital from \$10,000 to \$25,000.

Jeannette, Pa.—Pennsylvania Rubber Co. increases capital from \$1,500,000 to \$2,000,000.

Detroit, Mich.—Northway Motor Mfg. Co. increases capital from \$250,000 to \$1,000,000.

**Ann Arbor to Aid Automobile Project.**

Ann Arbor, Mich., is lending what seems like a willing ear to a project by which the Huron Mfg. Co., of Constantine, Mich., is to move to Ann Arbor and take up the manufacture of "Ann Arbor" motor cars and "Fawn" magnetos. The Board of Commerce has promised its assistance, and plans for stock selling and factory building are being carried forward together.

**To Build Cars in Saskatchewan.**

Having secured the Canadian manufacturing rights for Brush and Overland cars, the interests back of the Brush Canadian and the Canadian Overland companies have completed arrangements for the erection of their new factory at Regina, Sask. The buildings are to be completed by October, and the output is expected to be ready for the market by next spring.

**Americans Planning a Show in Mexico.**

Efforts are being made for the giving of an automobile show in Mexico City, Mex., next September. The promoters, Harry Hamm and Wilbur Cook, two young Americans, plan to make it a three days' affair.

**Changes Among Prominent Tradesmen.**

Harry Sellig has resigned as superintendent of Croxton-Keeton Motor Car Co., of Massillon, O. His future plans are not announced.

V. M. Palmer, chief engineer of the Selden Motor Vehicle Co., Rochester, N. Y., has resigned that position to go with the Sheldon Axle Co., of Wilkes-Barre, Pa. He will be chief engineer of the latter company, which makes automobile axles and other parts.

G. P. Blackiston has joined the advertising forces of the Berger Mfg. Co., of Canton, O., manufacturers of sheet metal products for the automobile and other trades. He has had a wide experience in metal trades advertising, and will manage the Berger campaigns.

F. E. Stuyvesant, who at one time was the Cleveland sales manager for White Co., of Cleveland, O., has developed a car of his own, which is to be called the Stuyvesant. His project contemplates the manufacture of three models, including a large six, a small six and a four.

L. W. Rinear has been made advertising manager of the White Co., of Cleveland, O., succeeding R. H. Johnston, who now is manager of the company's New York branch. Rinear has been advertising manager of Halle Bros., a Cleveland dry goods house, for the past six years.

R. G. Kelsey, who has been prominent in metropolitan automobile racing, has been appointed general manager of the Carhartt Motor Vehicle Sales Co., which is to handle the Carhartt "35" in the East. The car is built by the Carhartt Automobile Corporation, of Detroit, Mich., at the head of which is Hamilton Carhartt, a wealthy textile and clothing manufacturer of Detroit.

**Saturday-Closing Movement in New York.**

Dealers and branch houses in New York City are confronted with the question of whether they shall close their showrooms on Saturdays during July and August. A committee has been appointed by President Budlong of the Licensed Automobile Dealers, to act with a committee of the New York Automobile Trade Association in the effort to secure an agreement for Saturday closing. Out of 60 dealers already canvassed 44 favor closing, 9 are doubtful and 3 are opposed.

**Doherty Goes to Pacific Coast.**

Harry W. Doherty, sales manager of the Car Makers Selling Co., Chicago, Ill., has gone to the Pacific Coast to establish a distributing company for De Tamble and Anhut pleasure cars and Dart delivery wagons, for all of which the Chicago company is the general distributor. The new company on the coast is to handle the states of California, Oregon, Washington, Idaho and Nevada, and will have branches in Los Angeles, San Francisco and Seattle.

## IN THE RETAIL WORLD.

J. F. Billings has opened a sales room on West Seventh street, St. Joseph, Mo. He will sell Pullman cars.

The Wilkesbarre Automobile Co. has opened a new garage in the rear of Saunders hotel, Wilkesbarre, Pa.

The Pier Auto Co. is the style of a garage which has "opened up" at Richland Center, Wis. Keith Pier is the manager-owner.

The W. L. Hibbard Motor Car Co., of Milwaukee, Wis., has been dissolved. Notice of the dissolution has been filed in the Milwaukee courts.

The E. J. Willis Co., of 8 Park place, New York City, is about to move into new quarters, at 85 Chambers street. The concern deals in accessories.

Under the style the Ranson-Norton Motor Car Co. a new concern has opened up in Wheeling, W. Va. Stearns, Pullman and White cars will be featured.

C. J. Edwards just has opened a new fireproof garage on East College avenue, Appleton, Wis. He will specialize in repair work, but will also deal in accessories.

Richard M. Shaffer is building a two-story brick garage at 408-410 North Calvert street, Baltimore, Md. The structure will be 31 x 110 feet, and will cost \$5,000.

G. C. Seidel has gone into the automobile business in Philadelphia. He is building a garage, one story high, 50 x 50 feet, on Broad street, near Logan station.

H. D. & L. D. Porter have opened a garage and salesroom at 370 Golden Gate avenue, San Francisco, Cal. They have obtained the agency for Rapid Motor trucks.

L. B. Austin and Jesse Strough, of Beatrice, Neb., have purchased the garage and business of the Beatrice Automobile Co. The new owners will re-open the business on July 1.

Caused by explosion of gasoline vapor, fire started in the garage of W. S. Crowe, Manistique, Mich. Before it could be checked, damage amounting to over \$1,600 had been caused.

H. V. Hoffman, formerly with Thos. B. Jeffery & Co., Kenosha, Wis., has purchased the motor repair department of the C. F. Megow Co., 1003 Madison avenue, South Milwaukee.

Long & Bloom, who until last week conducted an automobile garage and repair shop at Churubusco, Ind., have dissolved partnership, Bloom retiring. Long will continue the business.

Charles W. Larson, Waukesha, Wis., has opened a garage at 524 Main street, and will conduct it under the style the Auto Supply Co. Overland cars are to be his chief stock-in-trade.

C. and H. C. D. Ryan, Phillipstown, N. J., are building a garage at 513-523 West 24th street, New York City. The new structure

will be two stories in height, 150 x 88.9 feet, and will cost \$55,000.

The building on Main street, Marshall, Texas., occupied by E. L. Stanley as a garage, was destroyed by fire last week. The loss has been fixed at \$3,000, partly covered by insurance.

The F. S. Hoaglin Auto Co., Oshkosh, Wis., is erecting a new fireproof garage near the Hotel Athern. The building will be 58 x 150 feet, one story high, with brick walls and cement floor.

Barberton, Ohio, is to have a new automobile garage. George Cook is building it. Only repair work will be done in the new place, as Cook has a sales room where he is showing Mitchell cars.

W. Baldwin and P. W. Rindfleisch, Plainfield, Wis., have rented a brick building and are putting in a cement floor and otherwise transforming it into a garage. They will do business as Baldwin & Co.

The new garage built for Harry Woods & Sons, at 402 State street, Santa Barbara, Cal., has been opened for business. It is 50 x 80 feet, and has a wing 30 x 50 feet, which is used as a repair shop.

Under the style of the Jefferson Auto Supply Co., Wm. Wagner and Frank Lamach, both of Two Rivers, Wis., have opened an accessories supplies store in Jefferson, Wis. Repair work also will be done.

Within a week the Utah Motor Car Co. will be installed in its new quarters at 125-127 State street, Salt Lake City, Utah. Besides doing general garage work, the company will carry a complete line of accessories.

Cambridge, Wis., soon is to have an up-to-date garage and automobile sales room, where Ford, Oakland, Buick, Oldsmobile and White gasoline cars are to be shown. O. H. Hanson and Theodore Tellefson are the owners.

I. L. Bell, B. C. Whitaker and A. B. Whitaker, all of St. Louis, Mo., have formed the American Garage Co., and opened a garage and repair shop at 5875-81 Delmar avenue. Everitt "30" and Rambler cars will be shown.

Pending the completion of its own new building at 427 North Meridian street, Indianapolis, Ind., the Interstate Automobile Co. has removed from its quarters at 10th street and Ft. Wayne avenue to 1512-1514 North Alabama street.

Dallas, Tex., has added another garage and salesroom to the already long list of such concerns doing business in that city. The new comer is styled Davis-Turney Automobile Co., and represents the Stevens-Duryea and Everitt "30" cars.

A. M. Hawley, who for some time has been associated with J. W. Foy in the automobile repair business on West Colorado street, Pasadena, Cal., has bought out his partner's interests. He will continue the business along the former lines.

The Curtis Automobile Co., Milwaukee, Wis., has moved into its new quarters at 142-144 Eighth street, four doors from Grand avenue. The structure is two stories high, 50 x 150 feet, and will be the future home of the Reo, Corbin and Hupmobile.

"Spontaneous combustion" in a box of excelsior was responsible for a blaze in the garage of the Independent Messenger Co., at 37 Stillson street, Rochester, N. Y., on June 21st. Two automobile delivery wagons were burnt before the blaze could be extinguished.

Fred D. Luescher, a well-known theatrical manager and owner of playhouses, has retired from the theatrical field and gone into the automobile business in Rochester, N. Y. He has located at 745 Park avenue in the Kodak city, where he is handling Rambler cars.

What is said to be the best equipped garage in any town of its size will be opened on July 1, in Mulvane, Kan., by the Nessley Automobile Co. The building is two stories high, 50 x 100 feet, of brick and concrete, and will shelter Hudson, Chalmers and Reo cars.

Creditors of Charles W. Louk, of Omaha, Neb., have filed a petition for involuntary bankruptcy against him. The creditors are the City National Bank (\$11,500), Empire Tire Co. (\$1,319.12), and Charles W. Partridge (\$400). Frank N. Clarke has been appointed receiver, under a bond of \$5,000.

Carl W. Fort & Co., agents for Gramm trucks, and J. Wyckliffe Goldsmith, Speedwell agent, have joined forces and opened large display rooms and a garage at 247-249 Peachtree street, Atlanta, Ga. The new firm will operate under the style Fulton Auto Supply Co., and handle a complete line of accessories and supplies.

Hook & Pettebone, who conducted the Square Garage in the rear of the Globe store in Wilkesbarre, Pa., have dissolved partnership. Roy Hook is to manage the business in the future, while Stephen Pettebone is making arrangements to have a new garage erected on North Main street, where he will hang out his own shingle.

Boldly invading the home city of the Studebaker company, the Rauch & Lang Electric Co., of Cleveland, Ohio, has established a co-operating agreement with the Otis Motor Car Co., of South Bend, Ind., under which the latter company will act as distributor for the Rauch electric. C. J. Martin represents the interests of the R. & L. Co.

A short but extremely dangerous blaze occurred last week on the top floor of the four-story garage at 104 West 107th street, New York City, owned by George Shaw. One of the automobiles stored there suddenly burst into flame, while being varnished, and before the blaze could be controlled, damage amounting to over \$2,000 had been caused.

# WHITE GASOLINE CARS

## for 1911

**SIZE AND POWER**—moderate, therefore, most economical to maintain.

**PRICE**—moderate, therefore, easy to buy.

**DESIGN**—includes many advanced features not found in any other American car.

**QUALITY**—The only moderate sized car wherein every part is just as well built as in the highest-price, high-powered cars.

**DELIVERY**—Very few open dates. First come, first served.

#### Keeping Clear the Car's Exterior.

One point of marked difference in the appearance of most cars of recent construction and their predecessors of a year or two ago is in the freedom of the exterior of the newer products from needless encumbrances. The present tendency is to free the running boards of everything that possibly can be dispensed with. In the torpedo types of body construction, this results in leaving both sides of the car practically uniform and innocent of all dust-catching protruberances. Incidentally, it results in concentrating within the chassis line the relatively small, though by no means insignificant, weights which the running boards have been called upon to support in the past.

The tendency is a good one because it distributes the extraneous load at points where it better can be taken care of, and also because it affords better protection for the auxiliaries and supplies than otherwise

could be afforded them. One manufacturer now conceals his gas tank behind a tool box, another suspends it in the rear of the chassis, taking advantage in this way of the fact that he uses a gasoline tank under the front seat of the body; still another places the tank in front of the radiator, where it has the advantage that a very short length of piping is required in order to serve the headlights. One maker has carried out the principle to the extent of mounting the battery box under the tonneau floor in certain types of his product. In the torpedo types, of course, the same general purpose is served to good advantage by the mounting of spare tires on the rear of the tonneau.

While there is no very great objection to the lumbering up of the vehicle exterior with accessories and containers, still it is obvious that where it is possible to locate them somewhere else without inconvenience or great expense, it is better to do so for the sake of appearance as well as for other reasons already noted. The space under the tonneau floor on either side of the propeller shaft is available with many forms of chassis construction, as is a narrow space at each side of the chassis directly beneath the frame. The under side of the running board also may be used to good advantage in certain types of car. Without sacrificing luggage carrying capacity in the least, it would be possible to secure a much more economical stowage of tools, batteries, tires and tanks on many cars, and the result would effect a considerable improvement in outward appearance and convenience.

#### The Stock Car and the A. A. A. Rules.

The communication of Mr. H. E. Coffin, chairman of the rules committee of the Manufacturers' Contest Association, bearing on the stock car controversy, which is printed in another column, probably is the most enlightening contribution to the subject which yet has been made public. But we do not believe that it will serve to change the general opinion that a stock car or a stock chassis which has been so altered that it no longer is "identical in specification, materials and design" with the "cars offered for sale and sold in a bonafide manner to the public"—to quote the language of the rules—has ceased to be a stock car or a stock chassis. We do not believe that Mr. Coffin himself will be able to disagree

with this view, and it represents the chief point involved.

If it was the intention of the rules that the stock car, as such, should mean an "identical" car, save for tops, windshields and tires, the definition of a stock chassis is in serious conflict with Rule 4, which requires that stock chassis also shall be "identical in specification, materials and design."

Substantially every reason enumerated by Mr. Coffin for the options or alterations permitted embodies merit, but not one of them affects the main issue. If it is safe and proper to use a car equipped with a body it is just as safe or safer to use a car without a body even though the latter may be denominated "stripped stock chassis," provided only that it truly is identical with the other. The body does not constitute the car.

Every option permitted is a premium on the exercise of ingenuity to make the most of it, and that there are those who are doing that very thing and stretching the options to the snapping point is self-evident. And so long as such options—why not call them alterations?—are sanctioned so long will the practice continue and grow worse instead of better.

The Motor World's whole contention is that no options or alterations of any sort should be permitted under any circumstances or for any reason. If for the purposes of high speed, changes are desirable or necessary in a car or a chassis, then find a designation for it into which the word "stock" does not enter. Call them Class A or Class B or Class X racers, if need be. But whatever is done, let the stock car and the stock chassis be neither more nor less than what the term implies. Let them be "identical in specification, materials and design" with those offered for sale to the public, exactly as the rules state is the case and as the public is led to believe is the case. Let them be such cars as the manufacturer will be glad to sell in Maine or Texas, or however far removed from the factory.

We thoroughly appreciate that the new rules represent a vast amount of thought and effort, and, as we have said on a previous occasion, they constitute no small improvement on their predecessors; but they can be bettered, and the adoption for an inflexible stock car and stock chassis definition is one way of bettering them. It is generosity on Mr. Coffin's part to wish to

## COMING EVENTS

turn the responsibility from the American Automobile Association to the Manufacturers' Contest Association, but without prejudice or desire to offend, may we point out that the M. C. A. is wholly without standing in the world of sports and that anything it may do is without force or effect until it is adopted and promulgated by the A. A. A.? The A. A. A. is the governing body; it is the one which other governing bodies recognize and with which they deal and enter into and maintain alliances. It is wise that it should desire the expert technical assistance of such men as comprise the Manufacturers' Contest Association, but any rules that result are the rules of the A. A. A. and the responsibility rests there and nowhere else.

Sport and Business are such direct opposites that any close relation that may be created at best can be but temporary. Business ultimately returns to its knitting, leaving Sport to go it alone, at which time Sport usually sadly is in need of a tonic. That automobile sport is "thoroughly commercialized," a fact which Mr. Coffin seems to question, is best attested by the existence of the Manufacturers' Contest Association and by Mr. Coffin's own observation in connection with a purely sporting situation, i. e., that the particular position to which he refers "would be dictated by business common sense." It is a matter of history—it is a foregone conclusion that manufacturers do not long retain interest in sport. It is not a part of their business, however desirable or profitable it may prove for the time being.

### Selling Cars on the Highroad.

Reverting to the good old days when traveling salesmen in the employ of carriage houses used to start on their routes towing a string of buggies over the road and staying out until they were all sold, it has been predicted more than once that automobile selling of certain limited sorts ultimately would assume somewhat the same aspect of door to door canvassing. While the industry has not arrived exactly at the stage where this method has become either expedient or profitable, it is yet to be observed that selling forces gradually are coming to make greater use of the high roads in getting about from point to point. This defrauds the railroads of a certain amount of freight tolls, it is true, but it also saves time, is more convenient and direct, and is a perfectly logical thing.

June 14-30.—American Automobile Association's seventh annual national touring and reliability contest for the Glidden trophy, starting from Cincinnati and finishing at Chicago.

June 28-30, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' Association's endurance run for "Star" trophy.

June 28-July 2, Denver, Col.—Denver "Post" 700 miles reliability run.

June 30, Winnipeg, Man.—Winnipeg Automobile Club's annual tour; 455 miles.

June 30, Lexington, Ky.—Bluegrass Motor Club's 160 miles sealed bonnet contest.

July 1, 2 and 4, Indianapolis, Ind.—Grand Circuit meeting on Motor Speedway.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 2, 3 and 4, Chicago, Ill.—Automobile races at Hawthorne track.

July 2-4, New York City—Touring Club of America's sociability-guessability run to Waterbury, Conn., and return; 200 miles.

July 4, Indianapolis, Ind.—Chicago Automobile Club's second annual race for the Cobe trophy on Motor Speedway.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach race meet on Ocean Drive.

July 4, Cumberland, Md.—Cumberland Fair and Agricultural Association's automobile races at fair grounds.

July 4, Muskegon, Mich.—Gentlemen's Driving Club's automobile race meet at Driving Park.

July 4, Birmingham, Ala.—Birmingham Automobile Club's race meet at state fair grounds.

July 4, Denver, Col.—Denver Motor Club's 200 miles road race; postponed from May 30.

July 4, St. Paul, Minn.—Minnesota State Automobile Association's race meet.

July 4, Cheyenne, Wyo.—Cheyenne Motor Club's race meet on motordrome.

July 4, Auburn, N. Y.—Auburn Automobile Club's hill climb.

July 4, Dallas, Tex.—Dallas Automobile Club's race meet.

July 4, Bloomington, Ind.—Bloomington Automobile Club's reliability contest.

July 7-9, Buffalo, N. Y.—Buffalo Automobile Trade Association's race meet.

July 8-9, Louisville, Ky.—Track meet at Churchill Downs; Homer George, promoter.

July 9, Plainfield, N. J.—Plainfield Automobile Club's second annual hill climb on Johnston's Drive, Watchung mountain.

July 9, Morrison, Col.—Town of Morrison's hill climb on Mount Morrison.

July 10, Cincinnati, O.—Track meet at Latonia Park; W. H. Wellman, promoter.

July 11, Plainfield, N. J.—Plainfield Automobile Club's annual hill climb.

July 11-15, Aberdeen, Wash.—Aberdeen Automobile Club's races on Cohasset Beach.

July 12, Charleston, S. C.—Charleston Automobile Club's beach races at Isle of Palms.

July 13, Winnipeg, Man.—Winnipeg Automobile Club-Winnipeg Motor Trades Association joint racemeet.

July 14, Chicago, Ill.—Chicago Automobile Trade Association's Orphans' Day.

July 14, Newport, Ind.—Newport Motor Club's second annual hillclimb.

July 15-16, Riverhead, L. I.—Motor Contest Association's second Long Island Stock Car Derby.

Thus dealers located in small towns in more or less isolated communities frequently find it to their advantage to take deliveries from the nearest factory branches over the road. This gives them opportunity to run in and adjust the machines, and upon arrival at their homes they are ready to turn the cars over to their customers as soon as they have been cleaned up. Similarly, dealers selling to customers some distance removed from their headquarters generally prefer the road method of delivery to using the railroad, because it enables them to turn over the machine in perfect running order. Likewise, instances have been known in which buyers, avoiding their own local dealers have gone to some metropolitan agent or branch, possibly several hundred miles away, and there secured the

services of a factory man for the tour home over the road. The advantage is that they can combine expert instruction with a good long maiden trip in the new car.

Even more suggestive in its possibilities is the experience of one man who, at the present time, is demonstrating a motor fire engine on the western coast. Making all the small towns, he finds it very much to his advantage to go from point to point over the road. Besides saving delays and securing direct routes, he makes considerable capital of the road-worthy qualities of the machine, and it may be noted that the machine has withstood creditably the effects of crossing a couple of mountain passes in addition to carrying out a number of demonstration in its own particular field of service.

# GLIDDEN TOUR NEARING ITS END

With One Day to Go, but 11 Survivors Remain—None Has Clean Score but Competition for Both Trophies is Close—Good Roads Follow the Frightful Ones—Disgruntled Participant Tries and Fails to Stop Contest.

MAXWELL CREW SWEARING ALLEGIANCE TO THE CAUSE OF GOOD ROADS

## Oklahoma Proves a Revelation; 15 of the 26 Starters Still in the Hunt

Oklahoma City, Okla., June 23.—Fifteen contesting cars that started from Cincinnati on June 14 arrived here this afternoon in various stages of dilapidation. Tell it not in Europe! Publish it not in automobilism! Only one of these still retains a clean score, and whether it is in perfect condition remains a guessing contest until the technical committee examines it in Chicago. So much has been said in the way of innuendoes reflecting upon its condition that each day hereafter a member of the technical committee will ride on the car as observer. The car is Chalmers No. 5, driven by Bill Bolger. This action was determined upon because other observers have reported penalizations against this particular car which the technical committee has wiped out as regularly as they were entered.

The slim line of cars that is parked in Oklahoma City this evening represents seven contestants for the Glidden Trophy and five for the Chicago Trophy, together with a pilot car and a pacemakers' car.

Where are the others? Ask the winds; perhaps they know.

Every non-competing car, including all the press cars, are somewhere in the rear. They did not get into Lawton last night. The scribes are Gliddening by train from control to control, and achieving greater punctuality in arriving than ever before.

Among the cars still out are Chalmers No. 3, Joe Matson, driver; Cole No. 6, driven by Henry Knight; Cartercar No. 8, W. C. Mahoney, driver; Parry No. 9, driven by Lester Marvelous Dull; Ohio cars No. 11 and 12, driven by J. W. Stockard and Ben Hilleck; Cole runabout No. 104, driven by A. L. Martin; Parry No. 105, driven by George Neff; Falcar No. 106, driven by C. F. Van Sicklen; Carter runabout No. 108, driven by Ray Landsheft, and its companion, No. 109, driven by F. R. Pendleton; Lexington No. 110, driven by E. O. Hayes; Westcott No. 111, driven by C. C. Bevington; both of the Cadillac "gunboats," manned by the cadets of the Northwestern Military College, and driven by Maj. A. P. Davidson and E. C. Garland; the Westcott press car; the Columbia pacemakers' car; the secretary's Reo car; the Chalmers press car; the two Cutting press cars; the Halladay press car, and the Great Western press car.

Those who can say "Hitherto the Lord helped us" are the drivers of Premier No. 1, Ray F. McNamara; Premier No. 2, Charles L. Ballinger; Chalmers No. 3, Joe Gardham; Chalmers No. 5, Bill Bolger; Maxwell No. 7, H. E. Walls; Glide No. 10, Fred Castle; Cino No. 15, Walter Donnelly; Moline No. 100, C. H. Van Dervoort; Moline No. 101, J. A. Wicke; Moline No. 102, F. W. Salisbury; Lexington, No.

103, J. C. Moore; and Maxwell No. 107, J. Illingsworth.

Five cars were penalized in today's run. The Premier No. 2 was taxed 156 points, the Glide 52 and the Cino 57. These were in the Glidden contest. In the Chicago trophy class, Moline No. 100 was penalized 4 points.

The tourists' began the day by lodging a kick against the management of the Midland hotel of Lawton, because no more than one-half of them could get breakfast. To them this appeared to be "rubbing it in," after they had to sleep anywhere from three to eight in a room.

The cars were checked out beginning at 7 o'clock, and because a short horse is soon curried, the last one was checked out at 7:15. The road out of Lawton was smooth, and 3 miles out entered the Indian reservation with the United States flag floating over Fort Sill, afar to the right. It was here that the old Apache tiger, Geronimo, was confined before being sent to Atlanta. Few Indians were seen during the run through the reservation, but outside the boundary they were encountered driving in wagons with cotton canopies and loaded to the gunwales with squaws and papooses. Sometimes an Indian cabin was passed with the "noble redskin" sitting calmly in the doorway watching Nokomis Minnehaha ply the hoe in his corn patches. Sometimes

\*\*\*\* Non-contestant.

it was a squawman who was seen in this role, his Indian wife and copper colored progeny doing all the work there was being done in sight. The Indians were greatly interested in the cars and asked "What going on in town tonight?" They appeared to think that something was going to happen in Apache, Anadarko or Chicasha.

The entire Oklahoma prairie appeared to be under cultivation outside of the reservation, and the tourists' eyes opened wide in wonderment at the endless fields of cotton, corn and alfalfa.

There was a stretch of sand for two miles out from Lawton, but it was nothing to the sand stretches of the day before. At a point three miles farther on there was a sudden drop into a rock bottomed creek. The water got into the clutches of some of the machines, and several were stalled and had to be pushed out by hand, the crew wading to their knees. It was a succession of prairie roads, generally good from there on.

At Chickasha there was a half hour stop, while members of the Elks' Club did the honors, entertaining all comers with a Dutch lunch. The city is a handsome one and has more miles of pavements in proportion to its population than are to be found in the entire state of Texas. El Reno was another live city that entertained the tourists at the noon stop. The automobile association and commercial club received the Gliddenites at the Elks' Club and served a Dutch lunch; also they spread hay over the half mile of sand in the neighborhood of the South Canadian river and a committee met the tourists at the bridge and escorted them to the city. El Reno showed the visitors what a live Oklahoma city is. It is 18 years old and has a population of 1,300, 152 blocks of pavements and holds its first fair on September 20.

Moline car No. 100, driven by C. H. Vandervoort, was delayed at a crossroad by the absence of confetti. Finally the driver asked a boy which way the cars had gone. The boy pointed to the left.

"But where is the paper that was thrown along here," asked driver Vandervoort.

"The goat et it," replied the boy pointing to the animal browsing along the route.

Vandervoort started off and the goat fled ahead, the Moline still following the confetti.

The automobile dealers of Oklahoma City gave the Gliddenites another Dutch lunch at 6:30 o'clock this evening at Belmont Park, and President Brock, of the board of trade, and Mayor H. M. Scales welcomed their guests with short speeches.

The run for tomorrow is 216 miles to Wichita, Kansas. The start will be made at 6 o'clock. The running schedule is 13 hours 30 minutes for the runabouts and 12 hours for the touring cars.

A late dispatch tonight reported that the Westcott press car, which was being shipped to this city to continue the tour was

smashed in a freight wreck. The Cadillac "gunboats" were reported to have arrived

in Lawton and are coming on after the vanguard. The Falcars, one of the Cutting

press cars and Cartercar No. 8 passed through that point at 8 o'clock this evening.

## "Miracles" Wrought by Healing Waters; Easy Going from Oklahoma into Kansas

Wichita, Kan., June 24.—The tenth ordeal of heat and thirst and rough roads and long mileage has been survived, and men and machines have stood up admirably, considering. Some of the Gliddenites are nearer the hospital and many of the cars are nearer the scrap heap, but that both have not attained those mournful destinies before this is almost miraculous and is creditable to the stability of both men and

on guard over the cars all night, and at Quebec the official garage was a warehouse. But in the morning, Tommie Forbes's Reo rolled out of the official garage with two brand new tires. In place of the two old ones worn to the fabric were two that looked as if they had just come from the tire factory.

The officials were amazed. There were the rules and the locked warehouse and the

ites. Even Mr. Forbes regarded it as plausible. To this day he attributes those new tires to the interposition of St. Anne.

But greater miracles even than this are being seen by the Gliddenites of 1910. When the cars arrived at Hot Springs they were severely shaken up and some were shaken apart. The 20 miles an hour schedule over the primitive forest roads and cowpaths of Kentucky, Tennessee, Mississippi and Ar-

THE FERRY AT FULTON, ARK., WHERE THE CARS CROSSED TWO AT A TIME

machines. Speaking of miracles, the Gliddenites are talking daily of prodigies that have taken place before their very eyes. They know now that the day of miracles is not past, and any wicked generation seeking a sign has missed it by not being upon this tour, where wonders grow daily over miracles taking place over night. The last miracle vouchsafed to the Gliddenites before this tour took place in the Glidden tour of 1906. Some of the survivors of the "Canadian Glidden," as it is called, because part of the route was in that country, recall the thrill experienced when it was announced one morning that a miracle had been accomplished during the night. The Reo car driven by Tommie Forbes was put in the official garage at Quebec with two worn and frazzled tires. In that tour time was not allowed for tire troubles, and nobody was allowed to work on tires or any other part of the car, once it was in the hands of the garage committee. To enforce this rule two watchmen were posted

two watchmen, but, on the other hand, there were the two new tires and the old ones had vanished. The watchmen swore stoutly that they saw and heard nothing all that night—no sound of tools knocking off the old and putting on the new. Mr. Forbes was equally mystified, but naturally delighted. Then it was recalled that the garage was in the jurisdiction of St. Anne de Beaupre, whose shrine was located a few miles away. Many of the Gliddenites had visited the place the previous afternoon, which was Sunday, and had seen the sick, the maimed, the halt and the blind climbing the holy stairs on their knees, praying for healing at every step. The Gliddenites had seen crutches stacked up, attesting to the efficacy of prayer, and waxen models of parts of the human body hung up in the church, votive offerings of the healed. Then it was suggested that if St. Anne could heal the sick and restore the blind, why not renovate and rejuvenate old tires? Simple explanation. It was accepted by the Glidden-

kansas had done well the work of dilapidation calculated by the officials of the contest committee. In particular, there was havoc with the radiators. Cars that survived the terrific jolting otherwise disclosed leaks.

The roads were sprinkled with drops as if the cars were sweating their lives out. It cost a penalization of 3 points every time a radiator was filled within 100 miles of the morning or noon control. To leave them emptied meant possible cracking of the cylinders from the heat. In this stress they arrived at Hot Springs last Sunday afternoon.

Now, the waters of the hot springs are celebrated for healing in letters so large that he who runs may read. But nobody supposed for a moment that they would exercise any healing influence on the running gear or the leaky radiators of the cars. But that Sunday radiators were filled with Hot Springs mineral water. And ever since, incredible as it may appear, strained

radiators have stopped leaking. In some instances the healing was instantaneous. Cars that stood in the street where they were parked with little pools under the radiators betraying the fatal drain, arrived that night in Texarkana as tight as a rivet. Others ran along for a day or so, but with one or two exceptions, there is not a leaking radiator in the tour today. The most peculiar feature of the miracle is that apparently natural methods were followed by the healing waters. Little patches of lead and traces of soldering can be seen by all but the members of the technical committee. Thus it often happens that wonders are revealed to babes and hidden from the wise and prudent. Some of the contestants apparently were discriminated against by the supernatural healing agency, for they had to stop between controls to stop leaks, thereby incurring penalizations. Why the Hot Springs water did not work in their cases as it did with the others is one of those things that nobody can find out.

Thus, among the penalizations meted out tonight were 21 points against Moline car No. 101, J. A. Wicke, driver, for filling a radiator seven times during the day's run; and the companion Moline, No. 102, suffered a penalization yesterday for repairing a

radiator leak. Chalmers No. 5, the only car that had a perfect score to date, lost it today and was penalized 3 points for repairing a broken fender iron. Moline No. 102 was penalized 15 points for five fills of its radiator, and the Cino car, which went out of the contest with a broken axle and entered again, was penalized 7 points.

The novelty of the day's run was the cool

WHERE THE PARRY WAS "IN BAD"

morning. There was almost a chill in the air when the Gliddenites left Oklahoma City

at 6 o'clock. At 21 miles out they ran into a shower. The effect on the clay road was like soaping the steps. Cars skidded for the ditches like ducklings scooting for the nearest water. Tire chains were resorted to, but the shower lasted only a few minutes. When the road dried, the chains were taken off. Then another shower came up and the chains had to be slapped on again.

The Gliddenites noted with satisfaction the gradual elimination of the black population in traveling northward. They were tired of seeing the colored element that infests the South like so many pernicious parasites, and the majority changed their views as to the political and social equality of the blacks with the whites after seeing the former breeding in their squalid and miserable cabins.

The Automobile Club of Enid, Okla., gave the tourists an appreciated welcome. They conducted them mysteriously to a place where beer was secreted in a huge tank and covered with ice. Talk about an oasis! After a 100 miles ride, the latter part of which was in a temperature of 101 degrees in the shade, and no shade—the beverage and the sandwiches were priceless boons. Enid is a dry town in a dry state, where even cigarettes are prohibited from sale.

## Disappointment on the Santa Fe Trail; One Car is Disqualified

Oh, the mayor sat in his office chair  
With a spy-glass clapt to his eye.  
"Has anyone seen this Glidden tour  
Of one hundred cars go by?  
A hundred cars they said to expect,  
And five hundred men or more,  
But I've waited around the whole blamed  
day,  
And darned if I've seen a score."

Kansas City, June 25.—It was not the mayor alone who was disappointed at the size of the Glidden tour that reached town by fragments at long intervals this afternoon and evening. The disappointment was general throughout the day.

"I've knocked off work to see this Glidden tour go by," said a farmer, perched on a fence with his family to the members of a contesting car that stopped right there.

"They tell me there's a hundred-odd automobiles in it. When does it come through?"

"Forget the hundred. The odd is all there is to it," replied one of the Gliddenites.

"Well, I swan," marveled the Missourian, adding: "It's odd enough all right."

Thirteen cars are not an unusual sight along the Santa Fe Trail, any day, so the Glidden tour did not occasion any great splash anywhere along the route. There were no crowds collected to see them pass through except in small towns, and they soon scattered when they learned that all there was to it was an occasional car, perhaps once in 15 minutes. As a spectacle the tour proved a disappointment.

The competing cars which arrived here were the three Molines, the Lexington and the Maxwell, the sole survivors of the Chicago division; the two Premiers, the two Chalmers, the Maxwell and the Glide, competing for the Glidden trophy, and the Chalmers No. 4, now being used as a pilot car; the Columbia, pacemaker; the Falcar, the Cino, the Cadillac "gunboats" and Ohio No. 12 all non-contestants arrived, some before dark and some past midnight. The Rapid truck is reported broken down on

COLUMBIA "BUMPING" THE BRIDGE

the other side of Oklahoma City. The Great Western press car is in trouble just outside the city. The Halladay press car eventually got through. Cartcar runabout No. 108, which broke down seven days

ago, undertook to come on by a short cut through the passes of the Ozark mountains from Mena, Ark. After incredible hardships its driver, F. R. Pendleton, and Pete Hanlon, together with a local guide, F. F. Roach, reached Lake Side Park, 150 miles from here; then the friction shaft broke and the car is there yet.

Sections of the old Santa Fe Trail traveled over today were found in what might well have been its primitive condition. It rained along it two days ago. The Gliddenites missed this, with their usual good luck. But the roads were rough and the cars went over them jiggety-jig. The vibration might well shake teeth loose, and did make the drivers swear. But there were smooth sections, and on the whole the going was a great improvement upon former conditions. In view of the betterment of the roads it made ridiculous the actions of the contest board in reducing the pace to 16 and 18 miles an hour. When the roads were at their worst over the second, third and fourth days of the tour, the pace was 18 and 20 miles an hour. The reason assigned was that the officials had awakened to the absurdity of entering the remaining night controls without any cars, realizing that the machines were dropping to pieces from the early indiscretions in the matter of too hot a pace in bad going.

It is proper to record that at Wichita the local automobile club welcomed the tourists with beverages prohibited throughout the state.

Two showers were encountered during the day, necessitating the precaution of tire chains.

The automobile club of Kansas City gave a Dutch lunch and vaudeville entertainment in honor of the tourists at the Savoy this evening. Tomorrow (Sunday) they take the visitors around the city on an

automobile ride to view the various sights

Chalmers car No. 3 was disqualified today for entering a blacksmith shop off the route for repairs. Driver Gardham stated he thought it was all right as long as the observer was there, too. The violation took place on the run to Dallas. In addition it was penalized 20 points for repairs.

The Glide was penalized 22 points for late arrival, and Moline No. 101 74 points for adjusting the steering gear.

The race from now on will be a close one for the Glidden trophy between Premier No. 1 and Chalmers No. 5, and for the Chicago trophy between Moline No. 100 and the Maxwell runabout.

## Parry Asks Court to Stop Tour; Some Penalizations are Remitted

Kansas City, June 26.—The worm has turned. As foreshadowed in these chroni-

Parry might slap an injunction upon them after midnight, stopping the tour instanter.

runabout No. 109 burned out an engine crank bearing on June 17, caused by swimming through the swamps of Mississippi on the run from Sheffield to Memphis.

Officials of the tour say that Mr. Parry also alleges that the Chalmers representative on the tour has the technical committee "buffaloed" and dominates the body, dictating the reports of the various observers. The officers deny these allegations and defy the allegator.

The officers profess to be puzzled to see where Mr. Parry has any standing in court, inasmuch as he is no longer entrant or contestant. If an injunction does not prevent, they propose to go along with the tour tomorrow and leave a lawyer here to fight it out in the courts.

Today the officials revised the penalizations from the start. No. 10, the Glide, had the penalizations of June 15 remitted, occasioned by getting water in the carburettor at an unsounded ford while following a false trail of confetti. No. 111, the Westcott, got a penalization for a

ONE OF THE MOLINE CREWS "COUNTING THE TIES"

cles, the entrants in the Annual Reliability Contest have begun to act, and on this the 13th day of the tour the poor old Glidden is up against it. After running against tree snags and tree stumps, and saw-tooth pavements, and fording creeks, and traversing forests trails on sometimes two wheels or three wheels at a time, the Glidden is now in the courts.

Today Max Parry, an observer and representative of the Parry Automobile Co. of Indianapolis, served notice by a local attorney upon the officials of the contest board that he proposes to stop the Gliddenites from further Gliddening. Clipped of legal verbiage, the notice proposes to enjoin the officers of the contest board from publishing the penalization sheets of the tour, and from using the score sheets in making up the final awards of the tour, and finally from continuing the tour itself beyond Kansas City. The notice advises Alan H. Whiting, referee; Alden L. McMurry, chairman, and David Beecroft, F. E. Edwards, Henry Souther, Alexander Churchward and Berne Nadel, of the technical committee; E. L. Ferguson, starter, and Chairman S. M. Butler to appear in the Circuit Court of Jackson county, Missouri, tomorrow morning and show cause why they should not be enjoined from doing all of the above things. But what worried the officials most was the possibility that Mr.

ABANDONING THE "RIGHT OF WAY" FOR NO WAY AT ALL

Chairman Butler was out late tonight looking up a lawyer to meet this contingency. As the tour is to start for Des Moines at 5 o'clock, some of the officials may sit up all night.

The score sheets which Mr. Parry objects to have published daily show that Parry car No. 9, Dull, driver, broke a crank shaft on Tuesday, June 21, and withdrew from the Glidden contest. Also that Parry

stalled motor remitted, no work being done on it. Other penalizations remitted were to the Cole runabout, Moline runabout No. 102, the Cino, Ohio No. 12, Cartercar No. 8, Chalmers No. 5, for troubles occasioned at Buffalo ford; to Parry No. 105, for getting a piece of iron wire; to Chalmers No. 4, for terminals on a spark plug and for water; To Maxwell No. 7, for gasoline required by following the pilot car 2 miles and back

on the wrong road; to the Glide for stopping the engine on spare time out of con-

trol and helping the pacemaker car up a hill, and to Parry No. 9 for a vent in the

gasolene tank which had been patched up by the ever obliging technical committee.

## Parry Suit Dismissed and Tour Moves On; Sunshine and Enthusiasm Follow Rain

Omaha, Neb., June 27.—"The dog it was that died," said the news heading of a mad dog scare.

Instead of the Parry Automobile Co., through Max Parry, enjoining the Glidden tour from Gliddening, the officials of the tour have ruled Mr. Parry's cars out of the tour, so that they no longer may continue even as non-contestants.

This action was decided upon at a meeting at the Rome hotel this evening. The committee started in to make Rome howl and succeeded very satisfactorily. The action of the officials was taken as a comeback at the attempt of the Parry representative to tie up the tour.

This morning Chairman S. M. Butler and Alden L. McMurtry appeared before Justice Seehorne in Kansas City and filed an answer, which was a general denial of all the allegations of Mr. Parry. They waived the formal summons and complaint in order to expedite matters. After waiting some time, Justice Seehorne dismissed the proceedings, the plaintiff, Mr. Parry, not putting in an appearance.

Justice Seehorne also informed Chairman Butler and Chairman McMurtry of the technical committee that he had denied three separate applications for a temporary

committee, for the Parry cars were ruled out of the contest. Of course the committee could not prohibit the Parry cars from using the same public highways as the Gliddenites used, and at the same time,

ever achieved in a Glidden tour. The 242 miles from Kansas City to this place required 17 hours for some of the contestants, especially those who had tire trouble. It was also a big day for penalizations.

HOW THE GLIDDENITES CROSSED THE MISSISSIPPI

THE CROSSING OF THE MISSISSIPPI ACCOMPLISHED

injunction which would have held the Gliddenites in Kansas City pending the settlement of the case in court.

Upon the arrival of the officials in this city this evening they notified Mr. Parry to appear before them and show cause why the Parry cars should not be eliminated altogether from the tour. Apparently the Parry representatives failed to satisfy the

but they could and did enjoin them from using any Glidden tour designations on the cars. So now the tour is smaller than ever. The officials intimate that the matter may be presented to the contest board for their further action.

While the officials were fighting in the courts, the contestants and non-contestants were reeling off the longest day's run

Premier No. 2 was penalized 18 points for making a new spring clip, and Chalmers No. 5, which has been in the lead for the Glidden trophy, was penalized 20 points for a new part on the steering knuckle. This gives the car a total penalization to date of 23 points; the Glide was penalized 118 points for tightening a fan belt and putting in a new front spring. The Cino was penalized 3 points for cleaning the magneto; Moline No. 101 was penalized 3 points for putting in gasolene out of control, and the Lexington roadster was penalized 10 points for adjusting the carburetter and tightening the lamp brackets.

There were gloomy forebodings when the last of the Gliddenites retired at midnight Sunday after their day of rest in Kansas City. A heavy shower was falling, and thoughts turned to slippery gumbo. When the tourists were called from their beds at 3:30 o'clock this morning, forebodings deepened. The rain was still falling heavily. The start was at 5 o'clock and a slow schedule of 16 and 14 miles an hour was adopted. The sun broke through, however, about 6:30 and the storm area was found to extend from Kansas City only as far as Leavenworth, Kan. The drivers crept for the first 20 miles. The gumbo was as slippery as a banana skin. Cars driven ever so carefully would slide off the crown of the road and sprawl toward the ditches. It was ticklish, especially when they started to skid toward

gullies and the approaches of culverts and bridges. After leaving Leavenworth, however, the roads were delightful, and the pleasures of touring were enjoyed as never before during the trip, when the cars started northward from St. Joseph. The country was rolling, and the cars played a never-ending game of see-saw. They climbed

hills and then dropped away into valleys. It was rise and fall constantly. The people along the route were enthusiastic. Approaching Maryville, Mo., the visitors found an overhead banner bidding them welcome and another at the opposite county line bidding them God-speed. At Maryville the members of the automobile club and Elks

provided a Dutch lunch. Outside the town line a group of young women stopped the cars and presented dishes of ice cream and cake to the Gliddenites.

At Tarkio the most appetizing basket lunch enjoyed thus far was given to some of the visitors. All declared that it was a most charming and hospitable country.

## Joy Ride Across Iowa; Penalizations That Intensify Competition

"PROSPECTIVE PURCHASERS" VIEW THE COLE IN TENNESSEE

Des Moines, Iowa, June 28.—All that the run of today required to constitute a genuine joy ride was a chorus girl and a reservation at the Waldorf-Astoria restaurant at 11:30 o'clock this evening. So sage and experienced members of the seventh annual American Automobile Association's reliability contest and Glidden tour assured one another this evening. All the other elements—smooth roads, good weather and absence of mechanical and tire troubles descended on the travel-worn Gliddenites like a benison.

Tonight they had accomplished 2,500 miles of the 2,851 miles set before them as a stunt by the contest board of the A. A. A. The finish was in sight, and they got here before dark, so the spirits of the contestants were exalted.

The Gliddenites today followed the "river to river" route across Iowa. It was as smooth as dry weather, and the King split log drag could make it. The roads were the apotheosis of dirt roads. There was a rain yesterday which the Gliddenites missed by one day. It was their usual luck, not only this year but also last year, and during the five preceding tours. The rain has always been one or two days ahead. It has been so this year, all through the southwest and the west.

Today the route was marked all the way from Omaha to Des Moines with signs denoting topographical conditions and direc-

"DEMONSTRATION" IN THE BLACK BELT OF ARKANSAS

tions. Each sign was marked by a small American flag by the Guthrie Automobile Association. Popular enthusiasm and interest reminded the participants of former tours. The river to river—Mississippi to Missouri—route was lined with people nearly all the way from Omaha to Des Moines. This means that every farm yard and farm gate has its group, and that every city and village poured out their entire pop-

ulations to see the attenuated procession. There were flags and tri-colored bunting and "welcomes" galore. The young women waved their hands and blew kisses. Everything indicated that Iowa takes the automobile seriously, and that the Iowa farmer reads all he can about it. In spite of the smooth road, penalizations were many—souvenirs of the days when the going was worse.

Premier No. 1 was penalized 2 points for a new fan belt, and Premier No. 2 was penalized 114 points for a new front spring; Chalmers No. 5 was debited 16 points for adjusting lift rods and other repairs, making a total to date of 59 points. Moline cars Nos. 101 and 102 were penalized 6 and 3 points, respectively, for taking on water outside of control, and Lexington car No. 103 was penalized 10 points for adjusting the carburetter and tightening lamp brackets.

This intensifies the struggles between the Premier and the Chalmers for the Glidden

trophy, and between the Moline No. 100 and Maxwell No. 107 for the Chicago trophy. The Maxwell arrived in control after the close of business this afternoon, and there were rumors of heavy penalizations for repairs to coils. It is indicated by the drift of betting showing that Moline No. 100 and Premier No. 1 are the favorites. Two more days will tell. Each car is sharply watched by its rivals, and there is

a great deal of talk of skullduggery. Accusations are flying back and forth that there is an understanding among different combinations of entrants that their observers shall favor their friends, and that there is a good deal of work being done upon cars between controls, behind barns and under many a green tree. There is considerable basis for the talk. There has not been a tour so loosely managed since the one of 1906, when there were no observers. But when the observers cannot be relied upon by the officials, the latter appear to be helpless. Quis custodiet ipsos custodes? The entrants, on the other hand, justify themselves with the assertion that they were flim-flammed into entering the tour and kept in the dark as to the actual road conditions, and therefore are entitled to do all they can to do justice to their cars.

The two Parry cars which were barred from continuing on the tour as non-contestants were meek followers of the procession today. The lettering telling of their being participants in the tour was rubbed off the bodies and bonnets with turpentine. Tonight the contest committee also issued the following announcement further prescribing the Parry cars:

"At a meeting of the contest board of the American Automobile Association held

having given wide publicity to such false allegations, all of which conduct on the part of the said Parry Automobile Co. is unseemly and prejudicial to the welfare of the sport and industry;

"It is therefore ordered and directed that the Parry Automobile Co. of Indianapolis,

sheltering the farmhouses from the prairie winds. Motor cars were thick throughout today's route, too. Where, they all came from was the subject of constant comment among the Gliddenites. And the same speculation arose as to where all the people came from. They lined the route in

ONE OF THE "BALLOON DESTROYERS" CHARGING A ROCKY FORD

"BALLOON DESTROYING" CADETS WHO ENCAMPED ENROUTE

at Des Moines, Iowa, June 28th, 1910:

"The Parry Automobile Co. of Indianapolis, Ind., having violated the rules of the contest board of the American Automobile Association, and having on June 25th, 1910, filed with the Circuit Court of Jackson county, Missouri, a petition containing false allegations against the members of the contest board and the officials appointed by it, and thereupon seeking to enjoin the American Automobile Association from the publication of official records of its 1910 annual tour in accordance with the rules, and from further continuing such tour, and

Ind., are hereby disqualified and rendered ineligible for entry in all contests held under the sanction of the contest board of the American Automobile Association until further notice."

In today's run the Gliddenites declared that they never saw so many dollars running around on hoofs as they did in field after field and farmyard after farmyard. Hogs worth almost their weight in silver and cattle above prices were as common as bull thistles in Texas. The distinctive charm of the Iowa landscape were the ever-recurring clumps of trees embowering and

buggies, farm wagons and automobiles, and without doubt for the next week little country weeklies along the route will be filled with such items as these:

"Mrs. Jed. Hasede gave a veranda party to see the Glidden tour on Tuesday. She entertained friends and relatives from Hawbuck....Mr. and Mrs. Si. Cornassel were visited by a large party of friends and relations during the Glidden tour....Mrs. Amanda Wheatgrower and daughter, Miranda, have as an attractive guest during the passing of the Glidden tourists Miss Hannah van Porkbreeder, of Jenny's Crossing, and in her honor gave a family dinner party last evening....Miss Mabel Stubblefield, who is in boarding school at Centerville, called at her father's house last Friday to see the Gliddenites go by. After the last car had passed, tea was served on the porch....The Ladies' Aid Society gave an ice cream festival on Friday evening, when the Glidden tourists passed the village. The festival netted \$11.25."

There was diversity on the travel today that made the run seem very short. The tourists raced up the prairie swells and dropped down other sides like a coon dropping out of a tree, as one expressed it. One could look miles back or ahead at any time during the day and see cars climbing or descending these great land swells.

At Guthrie, the noon control, the Ladies' Aid Society of the Methodist Episcopal Church was on the job again. They had spread a lunch in a grove on the outskirts of the town, and the Guthrie Automobile Club presented lunch tickets to every tour-

ist. The Ladies' Aid Society charged the club a quarter for each ticket, and if any

of the Gliddenites failed to get a ticket and sat down to lunch, the ladies pounced upon

him for 35 cents. The lunch was poor. But the crowd resembled circus day.

## Lining Up for the Last Day's Run; Branding the Sheep and the Goats

Davenport, Iowa, June 29th.—It will be a sick bunch of cars which Chairman Butler and Referee Whiting will lead across the finish line in Chicago tomorrow afternoon. All that started from Des Moines this

final lap is creditable to themselves and the skill of their drivers. Hats off to the eleven!

Today's run of 220 miles, which was easy, as it seemed on paper, produced its crop

dash oiler. The Glide in the Glidden class did not arrive in time to have its penalization for the day determined.

"String along, bossy, string along, and make all the show you can!" admonished the farmer to his lone cow, when unexpectedly friends came from a distance to see the great stock farm which he had been bragging about in letters. Chairman Butler finds himself in about the same predicament as to the showing the Glidden tour will make in Chicago tomorrow night. This will be the third time that Chicago has been the finish line for the Glidden tour, but never were there so few to finish as this time. It is not possible to run the cars in procession around and around a block, like a stage army to convey the impression of hosts, because of the numbers and names on the cars. Somebody would be sure to detect the trick. So orders have been issued that when the cars check in at Garfield Park, the official checking station in Chicago, tomorrow they be arranged in numerical order and will parade through the city. The line of march will be along Michigan avenue "automobile row" to 28th street, where the cars will be put into the official garage to await the doom of the recording angels of the technical board.

WHERE THE COLE BROKE ITS AXLE

morning arrived here tonight, but some of them were pretty groggy on the steeper ascents. They just managed to drag themselves over the crests with little to spare. The going was good, but they are all suffering more or less from premature breakdown induced by the ordeal of the Mississippi, Kentucky and Tennessee roads.

Eleven contestants survive to fight out the last round tomorrow. Six remain in the Glidden contest, including Premier No. 1, Premier No. 2, Chalmers No. 5, Maxwell No. 7, Glide No. 10 and Cino No. 15. The Premier seems to maintain a safe lead for the Glidden trophy, and has always been regarded as the probable winner. The five remaining in the Chicago trophy contest are Moline Nos. 100 and 102, Lexington and Maxwell No. 107. Moline No. 100 seems to hold a safe lead for the trophy and is expected to win, barring accidents or act of God. Of course there is a possibility that the technical examination may spring some surprises, but taking things as they lay, Premier No. 1 and Moline No. 100 will be the winners.

"These are they, which have come up out of great tribulation" would be an appropriate description of the contestants when they arrive in Chicago. Never were cars so severely tried as they have been in the tour which closes tomorrow, after 2,850 odd miles of motor-car-smashing combinations. That so many survive to make the

TERRAL (OKLA.) GREETING THE TOURISTS

of penalizations, mostly in the Chicago trophy class. The Cino was the only one of the Glidden class to be penalized; it lost 3 points for adjusting rocker arms.

Moline No. 101 got 69 points for radiator troubles, and Moline No. 102 3 points for taking on water. Maxwell No. 107, the nearest competitor to Moline No. 100 for the Chicago trophy, was set back 10 points for a new spring clip and adjusting the

In order that interlopers be barred and that those which have made the present tour with enough wheels, motors and steering apparatus to move under their own power may have proper recognition, the officials have affixed to the tonneau doors of the cars which have gone the full distance, either as contestants of non-contestants, an aluminum ring with the number of the car in white, which will indicate that

the cars bearing it have gone the entire distance of 2,853 miles. The press cars will have the letter "P" instead of a number, and the non-contestants the letter "N." So shall the public know the proper place and the proper objects to applaud. This precaution has been taken because several cars which fell by the wayside have been shipped here by freight in order to take part in the triumphal entry into Chicago.

It was the subject of hopeful comment on the run today that one of the drivers had become rich quick. The story as passed from tourist to tourist was that Rudolph Fass, driver of the Halladay press car, had learned during the tour that he

pants with sandwiches and bottles of beer from a well filled with ice. Under the circumstances, hot sun, many miles of dust, etc., the thoughtfulness of the Samaritans was appreciated. They were members of the Automobile Club of Iowa City, and held the function outside of the city limits, because the presentation and consumption of beer is frowned upon darkly in Iowa City by people who have a standing to maintain. There was the same widespread enthusiasm along the route as yesterday; the road was marked by flags and banners proclaiming that it was the river to river road; it was not as smooth as the section from Omaha to Des Moines.

was second, and John B. Bird, White, was third best forecaster.

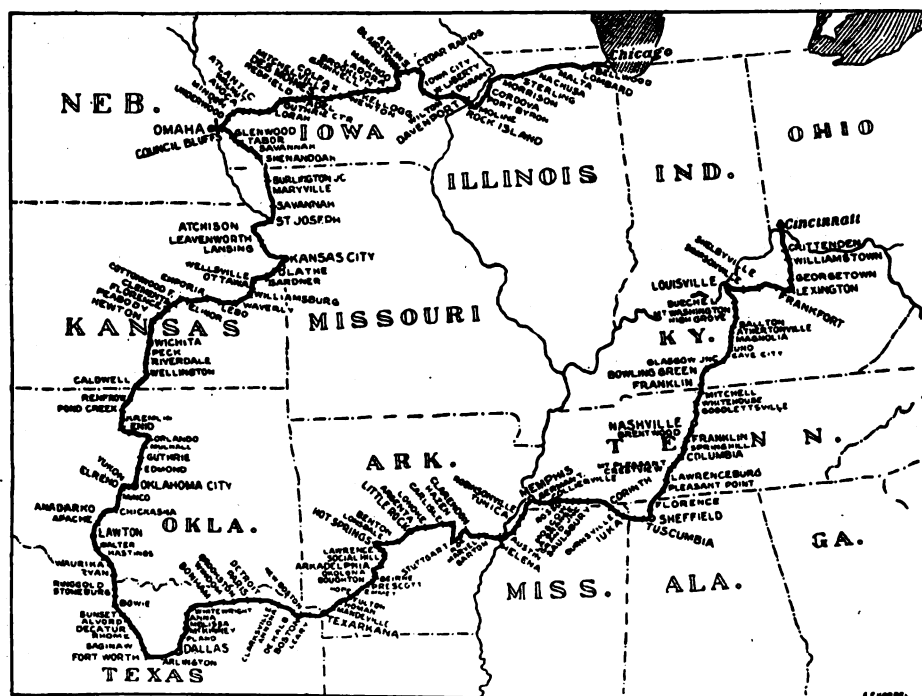

The contestants were the following: John R. Wilson, Stevens-Duryea; Howard D. Ross, Apperson; C. G. Cann, Maxwell; Coleman B. Harris, Cadillac; Courtland E. Pierson, E-M-F; Dr. John C. Fahey, Stoddard-Dayton; T. C. Marshall, Stanley; William C. Corey, Stevens-Duryea; J. D. Bush, Courier; E. M. Pennypacker, Peerless, and John B. Bird, White. All of the contestants finished. Oxford, Pa., was the turning point of the run, where the motorists stopped for dinner. The outward run was 30 miles, and the return trip over a different route amounted to 42 miles. Not only were the motorists thrown around in the tonneaus like dice in a shaker, by the thank-you-ma'ams, but they also were forced to get out and help push the leading car through a sink hole near London Grove, the whole party being stalled there by the miring of the first car.

#### Perils of Touring in Austria.

Now that the touring season is in full swing, the experiences of two innocent Saxon motorists, who just have been convicted for "smuggling" in Austria, are of more than usual interest. In both cases the "malefactors" unknowingly passed the customs. The first, having taken a wrong turn and thereby missed the Austrian "douane," was peacefully pursuing his way, when he was stopped by a gendarme, as his Austrian sign plate was missing. His astounded query whether he was on Austrian soil was promptly answered by a fine. In the second case, the motorist was in possession of all the legal documents demanded—and remained for some time in Austria. He desired a prolongation of his "trip-tique," and on its being handed in at the official quarters it was found that the frontier stamp was missing. He also was fined. An appeal was lodged in each case, but was not granted, as the finance ministry in Vienna declared that passing a "douane"—whether accidentally or intentionally—without complying with due formalities "involved intended smuggling" and would be punished accordingly.

#### Touched Nine States in 24 Hours.

Touching nine states within 24 hours is a feat accomplished by a Metz car, driven successively by J. C. Robbins, D. H. Miller and John McGann, and which, it is believed, establishes a record of its sort. The route was from Iron Hill, Md., to Winchester, N. H., and during a trip of 23 hours and 44 minutes the car, after leaving Maryland, passed through Wilmington, Del.; Philadelphia, Pa.; Trenton, N. J.; New Brunswick, N. J.; Newark, N. J.; New York, N. Y.; Bridgeport, Conn.; New Haven, Conn.; Springfield, Mass.; Holyoke, Mass.; Greenfield, Mass.; Vernon, Vt.; Winchester, N. H. The car left Iron Hill at 12:01 a. m. on June 21st.

THE ROUTE OF THE GLIDDEN TOUR

had fallen heir to \$1,500,000 from his grandfather in Germany. It was the general sentiment that the story would be important if it were only true, but in view of the fact that Mr. Fass was the driver of a press car—well, you cannot always tell.

The day's run was marked by two incidents that relieved the monotony of driving over the prairie swells of Iowa on smooth roads. One was a reception arranged at Marengo in honor of Cecil Dillon and J. A. Wicke, of the Moline "Dreadnought Squadron," both of whom are residents of the village. In honor of their homecoming, the citizens of the place arranged a dinner provided by the ever-on-the-job Ladies' Aid Society of the Methodist Church. The dinner was participated in by all the Gliddenites, and was voted a great success; they even awarded a vote of thanks to Messrs. Wicke and Dillon for having been residents of Marengo.

The other incident took place at the top of a small hill between Cedar Rapids and Iowa City. Here a group of Samaritans stopped each car and presented the occu-

The start tomorrow morning will be at 6 o'clock. The noon control will be at Rochelle, from which there will be a quick run for Chicago. The schedule for the run is 8 hours 43 minutes for the Glidden contestants and 9 hours 43 minutes for the Chicago trophy class.

#### Delaware "Guessabilites" Get Jolted.

Guessing the number of jolts which they received in the 72 miles which were studded with waterbreaks, ruts and gullies would have been a more appropriate mental exercise for the contestants in the Delaware Automobile Association of Wilmington's sealed time or "guessability" run on Saturday, 26th inst. Small as it is, the Peachtree state boasts of some mighty uneven roads, as the party discovered. Despite the bad roads, however, good time was made; the winner, Coleman B. Harris, Cadillac, calculating his schedule within five minutes of the official figures in the envelope. His running time was 4 hours 19 minutes, or 5 minutes more than the official allowance. Courtland E. Pierson, E-M-F,

**IOWANS IN A "LITTLE GLIDDEN"**

**More Perfect Scores than in the Big Event,  
However—Two Protests Against  
Perfect Score Cars.**

In adopting the appellation "Little Glidden" for their first endurance contest, held on the 20-23inst., the Iowa Automobile Club of Des Moines must have intended to do honor to the real Gliddenites, who were their guests a few days later, for as far as real resemblance went the disparity between the two was 1 to 1,000. With the disallowance of the protests filed against the Locomobile and Auburn, which were found to have been based on unreliable and questionable grounds, 7 cars finished with perfect scores as follows: Class A—Cheney R. Prouty, Locomobile. Class B—M. E. Leasure, Auburn; American Motor Car Co., Cadillac; Cruzan & Co., Inter-State. Class C—Cruzan & Co., Cartercar. Class D—Edward Southwick, Ford; Max Hamilton, Buick. The others who, although penalized, received prizes were the following: W. H. Fowler, Premier; Milton Goldman, Mitchell; Craven Garage Co., Cole; and Herring Motor Car Co., Ford. Twenty-one cars finished.

In one respect, however, the Iowa contest resembled its more famous namesake, in that it attracted nearly as many starters, 24 contesting cars being sent away on Monday morning as follows: Class A—Iowa Auto & Supply Co., Locomobile (2); John H. Gibson, Thomas; Jesse O. Wells, Wells; Herring Motor Car Co., Premier. Class B—Strong Motor Car Co., Apperson; Riddell Auto Co., Ohio; Brown-Williams Co., Auburn; Cruzan & Co., Inter-State; American Motor Car Co., Cadillac. Class C—Wells Auto & Livery Co., Moon; Cruzan & Co., Cartercar; Craven Garage Co., Cole; L. C. Perkins, Overland; Des Moines Motor Sales Co., Petrel and Halladay; Musgrave Fence & Auto Co., Black-Crow; Milt Goldman, Mitchell; Sears Automobile Co., Reo. Class D—Riddell Auto Co., Buick (2); Ideal Auto Co., Overland; Herring Motor Car Co., Ford (2).

Four days allowed for 450 miles was much in the nature of a go-as-you-please affair, rather than a contest, in view of the good roads which were encountered most of the way, and loafing on approaching controls was the usual order of things. The route took the motorists through the northern and central sections of the state, the night controls being as follows: Monday, Jefferson; Tuesday, Spirit Lake, and Wednesday, Fort Dodge. Despite the good roads only nine cars made the 71 miles run to Jefferson without penalization. The best roads were encountered in Greene county where they showed much evidence of recent preparation for the run. About the most un-

pleasant feature of the day's run was the heat and dust from which the tourists suffered. Most of the day's penalties were inflicted for minor mechanical troubles, none of the cars experiencing serious mishaps. When the scores for the first day were posted somewhat of a sensation was caused by the failure of the report to indicate any penalties for No. 1 Locomobile in Class A, although it was alleged by several that the motor was stopped during the day. This car later was protested.

Upon the arrival of the cars at Spirit Lake Tuesday night only seven perfect scores remained, the long run of 162 miles coupled with some bad stretches having ousted four contenders from the honor division. The heaviest sufferer was the Moon No. 23, which ran out of oil and "gas" near Poca-hontas and was docked 38 points. It was noticeable on Tuesday that some of the contestants evinced a desire to steal a slice of the pilot car's thunder by slipping past it and heading the procession as the cars rolled through the towns en route.

Protests were filed against two perfect score cars, the Locomobile No. 1 and Auburn, on Wednesday, and await the decision of the technical committee at the conclusion of the contest. While some of the penalized ones received further assessments on the run to Fort Dodge the perfect score coterie escaped unscathed. The final day's run home on Thursday was comparatively easy, all of the cars finishing on time early in the afternoon. On the last leg, the pilot flags were transferred twice on account of mechanical and tire troubles, and the officials barely arrived as per schedule. After being checked in the cars were turned over to the technical committee for examination.

**Thirty Days for Two Joy Riders.**

Using his employer's car without the latter's permission cost a Philadelphia chauffeur thirty days in jail. The same sentence was imposed by the same judge on another chauffeur who, while employed in one of the large garages, helped himself to one of the cars stored there, the owner of which was out of town at the time of "borrowing." Justice Davis, in imposing these sentences, declared he intended to make it an unhealthy sport for chauffeurs or other garage employes to use other people's cars without even asking or saying: "By your leave."

**Where Motorcycles Outnumber Motor Cars.**

Denmark boasted a sum total of 700 motor cars at the time of the last accounting in September, 1909. Of these, more than half, or 375, were in Copenhagen, this number including 138 motor cabs. There are also about 3,500 motorcycles in the country. Practically all the cars have been imported from Germany, France, England and the United States, and most of the well known European and American marks are represented.

**WOMEN GOOD TWO-DAYS GUESSERS**

**Capture Most of the Numerous Trophies in  
Philadelphians' Run—Private Prize  
for Control Committee.**

Longer than most functions of the sort, the two days' guessability run of the Automobile Club of Philadelphia (Pa.) to Lake Hopatcong, N. J., and return on Saturday and Sunday, 25-26, was notable for the number of trophies offered and the fact that women drivers won most of them on the first day's run. In addition to the handsome prizes offered by the club and the contest committee, the intermediate towns on the route also hung up trophies. Mrs. Edward Wilkie, Buick, captured the Somerville cup for closest adherence to the secret schedule to that town, and Mrs. D. Walter Harper, Stanley, was awarded the Lake Hopatcong cup for a similar performance to that point. Mrs. Wilkie was off schedule less than a minute, and Mrs. Harper came within 5 seconds of the official figures.

On the homeward run, on Sunday, however, the men came into their own and captured all of the remaining prizes offered. Allan Lund, driving a Marmon, was awarded first prize, a grandfather's clock, for the best time average for the two days, varying but 2 minutes 59 seconds from the official running time of 15 hours 10 minutes and 16 seconds. D. W. Harper, Pierce-Racine, whose wife was a prize winner on the first day, duplicated her performance by taking second award, a lunch hamper, for second best time for the two days. He was penalized 3 minutes and 45 seconds. Although Joseph Hutchinson drove a Marmon during the two days, with but 10 seconds penalization, strange to say he did not win first prize, although on the face of things he clearly was entitled to it. However, his performance did not go unrewarded for he was given the trophy offered by the Morristown Automobile Club.

An innovation introduced by the contest committee indicated a high sense of moral ethics on the part of the members of that body, who, desiring to compete in the contest, felt that inasmuch as they would have to pass judgment on the winners, in fairness to all they would put up a prize of their own to be competed for exclusively by themselves. This was a handsome old-fashioned clock on which was mounted a miniature silver replica of a car. This trophy was won by Committeeman Frank Eveland, who drove a Stevens-Duryea and was 20 minutes 36 seconds off schedule. The official time to Lake Hopatcong was 6 hours, 54 minutes and 10 seconds. Thirty cars participated in the run, spending the night at Lake Hopatcong and returning Sunday via Hackettstown, Easton and Norristown.

# HUDSON AND

THE HUDSON MOTOR CAR CO. has been an entirely separate organization since January 1st, 1910, complete in itself and allied with no other concern. From the beginning, the controlling interest has been held by the present officers. Our production plans comprise the closing of this season in the fall.

We are now supplying our dealers at the rate of 800 cars per month. Many of our Agency contracts are now expiring, and we are ready to talk business on certain territory in various sections of the country—possibly yours—which we have open, including two or three of the larger cities where we desire exclusive representation. Contracts have already been closed, with deposits for over 4,600 cars. Applications to our sales department can be made by letter, wire or “phone” and will be filed and handled in order received. If your territory is closed, we will give you immediate notice. We suggest that you use night lettergram giving full information.

The new half million dollar Hudson factory is well under way and will be one of the finest automobile plants in

**OLDFIELD & CO., SAVE THE MEET**

**Four Days Affair at Minneapolis Gives them a Chance to Gather "Records"—Harroun Wins a Match.**

Barney Oldfield & Co. played a four days' engagement at the Twin City aviation meet at Minneapolis, Minn., June 22-25, and really were the salvation of the carnival, for although "nine of the twelve greatest aviators in America" were present, their combined feats of daring did not surpass the thrilling performances of America's premier troupe of motoring barnstormers. Something like half a dozen "world's circular dirt track records" were lowered, all excepting one of which gave way before the onslaughts of the star himself.

Record trials formed a large proportion of the automobile events, and on the opening day, Wednesday, Oldfield drove the Benz one mile in :49 $\frac{3}{4}$ , and two miles in 1:40, both of which were announced as "world's records." Shortly afterward, Kerscher emulated his chief by assaulting the three miles mark and establishing new figures of 2:36 $\frac{3}{4}$ . On Thursday a record trial by Oldfield reduced his mile figures of the previous day from :49 $\frac{3}{4}$  to 49 $\frac{3}{8}$ . (Loud applause.) Ray Harroun, Marmon, defeated McLane, Buick, in the first heat of a match race.

Oldfield sent the four miles record glimmering on Friday, and also defeated Harroun in a five miles match. It was a bad day for Harroun all around, for he also lost the second heat of his match with McLane. The Marmon "Wasp" was off its feed all day. Kerscher also gained more fame by trimming Clark, Cutting, in a three miles match. The long continued hot spell was broken on Saturday, the final day of the meeting, by a torrential rain, which fell in fits and starts and kept the spectators scurrying between the open and cover. Although the storm cleared the air and benefited the sky pilots, it converted the mile track into a sea of mud and forced the speed merchants to take to the inner half-mile oval in order to finish their program. Nevertheless, Oldfield established a new "mile record for a half mile track" in 1:08 $\frac{3}{8}$ . Harroun won the deciding heat of his match with McLane and the "\$1,200" purse that went with it, according to the management. It seems almost too good to believe that Oldfield would let \$1,200 in real money slip by him so easy without attempting to annex it.

**First Day—Wednesday, 23rd.**

Liberal use of space in the local papers drew a crowd of 18,000 persons to the state fair grounds for the opening day, but although the bird men were touted as the star attraction, the air was not suited to

skylarking and, as their flights were weak and generally ended in their return to earth in a wheat field, it devolved upon the Oldfield aggregation to give the crowd their money's worth of thrills. Barney opened the ball with an attack on the track record of 0:50 $\frac{3}{4}$  for a mile, made by De Palma last year. He reduced it to :49 $\frac{3}{4}$ , which was duly announced as a world's mark for a dirt circular course. He also broke his own two miles figures of 1:44 $\frac{3}{4}$ , made at the Los Angeles (Cal.) Motordrome in April, tearing off the two circuits in 1:40. This performance apparently does not redound to the credit of the planked dish on the shores of the Pacific, when a record made thereon can be shattered on a flat dirt course.

Kerscher also participated in the embezzling of records from DePalma by annexing his three miles figures. He made the three circuits in 2:36 $\frac{3}{4}$ , bettering the previous time by 2 $\frac{3}{8}$  seconds. The record trials out of the way, the competition events were staged. Through a too liberal handicap, Clark in the Cutting won the 5 miles handicap in 5:23 $\frac{1}{2}$ . He had 35 seconds on Oldfield, who was on scratch, and won by 9 seconds, Oldfield taking second. The racing for the day wound up with a five miles match between Kerscher and Harroun, which was won by the former. Time, 5:05 $\frac{3}{8}$ . The summaries:

Time trials—1 mile by Oldfield, Benz. Time, 0:49 $\frac{3}{4}$ . Record. 2 miles by Oldfield, Benz. Time, 1:40. Record. 3 miles by Kerscher, Darracq. Time, 2:36 $\frac{3}{4}$ . Record.

Five miles handicap—Won by George Clark, Cutting (35); second, Oldfield, Knox (scratch); third, Harroun, Marmon (5). Time, 5:23 $\frac{1}{2}$ .

Ten miles handicap—Won by Oldfield, Knox; second, Clark, Cutting. Time, 10:14 $\frac{3}{8}$ . Kerscher and Perkins also ran.

Five miles—Won by Kerscher, Darracq; second, Harroun, Marmon. Time, 5:05 $\frac{3}{8}$ .

**Second Day—Thursday, 24th.**

To compensate for their failure to come up to expectations on the opening day, the aviators were told that they would have to do better on Thursday, and the day practically was given over to air stunts. Only two speed events were held, a time trial by Oldfield and the first heat of a match between Harroun and McLane, Buick. Oldfield kicked up a lot of dust, and brought a volley of cheers from the crowd, which was not as large as on the opening day, by skirting the oval in 0:49 $\frac{3}{8}$ . Harroun easily trimmed McLane in the first heat of their 5 miles match. The summaries:

Time trial—1 mile, by Oldfield, Benz. Time, 0:49 $\frac{3}{8}$ . Record.

Five miles match between Harroun, Marmon, and McLane, Buick. First heat won by Harroun.

**Third Day—Friday, 25th.**

Both motor cars and aeroplanes shared honors on Friday, each furnishing suffi-

cient thrills to make the large crowd feel that it was repaid for coming. In raising "record" crops Oldfield is quite successful, and harvested another bunch in his granary. This time it was the "four miles circular track record" which fell, and which was credited to DePalma in 3:34 $\frac{3}{8}$  on the same course. Oldfield bit off a big morsel of time by being clocked in 3:24. He topped off this achievement by beating Harroun in a five miles match, and incidentally cut the existing "dirt track record" from 4:52 $\frac{1}{2}$  to 4:50.

Having finished his part, Oldfield left the stage—or, rather, track—and his understudy, Kerscher, came on. He started well by defeating Clark, Cutting, in a 3 miles match, but failed in his attack on Oldfield's 2 miles record of 1:40, established the previous day. The Dutch pilot was timed in 1:41 $\frac{3}{8}$ . Harroun's engine was out of sorts, which accounted for his defeat by McLane in the second heat of their match at 10 miles. Time, 10:50 $\frac{3}{8}$ . The summaries:

Three miles match—Won by Ben Kerscher, Darracq; second, George Clark, Cutting. Time, 3:26 $\frac{3}{8}$ .

Five miles match—Won by Oldfield, Knox; second, Harroun, Marmon. Time, 4:50. Record.

Time trials—2 miles by Kerscher, Darracq. Time, 1:41 $\frac{3}{8}$ . 4 miles by Oldfield, Benz. Time, 3:24. Record.

Match between Harroun, Marmon, and McLane, Buick. Second heat, 10 miles—Won by McLane. Time, 10:50 $\frac{3}{8}$ .

**Final Day—Saturday, 25th.**

With only a fair crowd present, the final day's card was staged under adverse weather conditions. Shortly after the meeting opened, rain began to fall, and although it benefited the air men by clearing the atmosphere, it also played hob with the mile course, so that the automobile end of the program was shifted to the inner half mile oval, the clay surface of which better withstood the attacks of the elements.

The capers of the aeronauts were comparatively tame and interest centered in the doings of the cars. The chief thing on the tapis was the deciding heat of the match between Harroun and McLane, and the former captured it easily. The distance was 10 miles, which was reeled off in 4:11 $\frac{3}{8}$ . Harroun signalized his final appearance of the meet by winning the 3 miles handicap in 4:52 $\frac{3}{8}$ . The switch to the small track gave Oldfield an excuse to establish a "mile record for half mile tracks," the time being 1:08 $\frac{3}{8}$ . The summaries:

Three miles handicap—Won by Harroun, Marmon. Time, 4:52 $\frac{3}{8}$ .

Match between Harroun, Marmon and McLane, Buick. Ten miles, final and deciding heat—Won by Harroun. Time, 14:11 $\frac{3}{8}$ .

Time trial—1 mile by Oldfield, Benz. Time, 1:08 $\frac{3}{8}$ . Record for half mile track.

**OVERSHADOWED BY "INVADERS"**

**Port Jefferson Amateurs Eclipsed in Local Club's Hill Climb—De Palma Takes the Free-for-All.**

"Invaders" from New York City were the whole show at the hill climb of the Automobile Club of Port Jefferson (L. I.) on last Saturday, 25th inst., and captured every event in which they were eligible. The only classes which they did not win were a few amateur divisions which were confined to local drivers. For a maiden effort in staging a climb, the club did itself proud, putting on a card of 15 events which

out a field of larger cars. He went up in 0:29.30, the last to get inside the half minute mark.

Knox cars were the largest mark winners and the most consistent performers, capturing four firsts in addition to third in the big class. Belcher was at the wheel of two of the winners, capturing his class in the price division in 0:30.45, and again leading the field in the 301-450 stock chassis aggregation with a flight in 0:28.60. C. M. Rutherford, National, was the runner up both times. Louis Disbrow gained more laurels for the Knox by piloting one of these machines to victory in the 451-600 stock chassis class. He went the route in 0:31.09. W. J. Fallon rounded out the Knox quartet of winners by annexing the class

J. A. Turner, Matheson, easily defeated W. Jones, Thomas, for the spoils in the \$3,001-\$4,000 contingent, in which they were the only starters. The winner's time was 0:35.93. The high priced division, \$4,001 and over, was carried off by Martin, Houpt, in 0:33.95.

With an average grade of 10 per cent., rising to 15 in places, the course was in fine shape, having been well prepared by the county highway supervisor. Deputy sheriffs patrolled the road, but were not called upon to exert themselves much, the 5,000 spectators keeping well outside the danger zone. The cars were allowed a take-off of 400 feet, the course beginning in the main street of the town and finishing at the Belle Terre Club, which thoughtfully

BELCHER (KNOX) MAKING HIS FAST FLIGHT

SWAN (STEARNS) ROUNDING THE ELBOW AT SPEED

attracted a record-breaking entry of nearly 100 cars. The contest was a most successful one from every standpoint.

Ralph DePalma with his big 200 horsepower Fiat was the headliner of the day, and outclassed all of the others excepting his "amateur" stablemate, Caleb Bragg, who trailed him close in the stellar division, the free-for-all. De Palma was bent on winning this premier class, and with his great surplus of power there was nothing to prevent him accomplishing his purpose, except accident, and fortunately there was none. With a roar that made the ground tremble, the big red car leaped from the line and hurtled up the 2,000 foot incline at a 60 miles clip, and flashed past the finish tape in 0:20.48. This, the best time of the day, set a record for the hill, but Bragg came dangerously close to erasing his mate's figures by a flight in 0:21.30. This performance was quite a surprise, as Bragg drove a much lower powered car. Fred Belcher had a Knox with a spiteful bark which indicated business, and proved it by running a good third. The electric apparatus caught him in 0:27.61. Another creditable showing was made by J. R. Kirkpatrick, Columbia, who ran fourth and beat

comprised of Port Jefferson owners only.

Good time and close finishes made the amateur events quite exciting. Jackson cars made a clean sweep in the \$1,201-\$2,000 class for amateurs, E. J. Hutchinson driving the winner. His time was fast, 0:39.55. After participating in several of the trade classes and being creditably placed, Rutherford came into his own in the amateur class for cars costing over \$2,000 and topped the figures of his competitors with a climb in 0:31.84, fast enough to win and then some. C. G. Goddard in another National was the runner up. Kingsley Swan had an easy victory with his Stearns, in the class open to members of the Long Island A. C. and Crescent A. C. He "trimmed" his only rival, H. A. Trimm, Buick, by 16 seconds, crossing the finish line in 0:36.93.

The minimum stock chassis class 161-230 cubic inches, was hotly contested, H. P. Holt, Pope-Hartford, taking first honors by a close margin in 0:32.32. Joseph Taylor, Correja, was second with 0:32.44. Taylor also captured his class, defeating Charles Jones, Buick. The winner's time was 0:36.24. Among the little cars, D. M. Bellman, Hupmobile, and W. Blair, Ford, were the high score men, each winning his class.

**Hughes Signs the "Horse Trot" Bill.**

Governor Hughes evidently agrees with Mayor Gaynor of New York that it is "just" to set aside a midsection of a popular public highway for horse racing purposes and to make trespassers of all citizens who in motor cars or on bicycles dare venture on the road. At any rate on Monday last the governor signed the so-called "horse trot" bill which turns over a mile and a half of the Coney Island boulevard in Brooklyn to a handful of horsemen who own highsteppers. When the opposition to the measure was at its height, some of the opponents threatened to test its legality if it became a law.

**Reading Club Elects a President.**

Although the Reading (Pa.) Automobile Club has been organized a little over a month, it was without a president until last week, when the members elected E. S. Wertz to that office.

**CLAIM SMITH IS NO "GENTLEMAN"****Contenders in Mt. Vernon Club's tame Meet Protest a Winner—Accuse Him of Too Much Imagination.**

With only five of the thirteen programmed events decided, the course many inches deep with dust, and a double protest filed against the winner of one race, it cannot be said that the first annual race meet of the Mt. Vernon (N. Y.) Automobile Club at the Empire City track, Yonkers, on Saturday last, 26th inst., was an overwhelming success. Although styled a "Gentlemen's meet," in which only amateurs were eligible, it would appear that some black sheep found their way into the fold and provoked some unlamblike feeling.

Of some 35 competitors, Spencer Wishart, the youthful Long Islander who made his racing debut in the last Vanderbilt, was the most conspicuous, and although he drove a 7 year old Mercedes, it had an abundance of speed and simply walked away from his rivals. Wishart captured the feature race, the Westchester County Gentlemen's handicap at 10 miles. It was run in four 5 miles heats, and a 10 miles final, the heat winners starting in the latter. In the final Wishart was on scratch and gave various allowances to the others, but the handicapping was so poor that he caught the limit man at three miles and won as he pleased. M. P. Batts, S. P. O., was second. The time, 12:25½.

Russell Smith, a crafty youngster upon whom the order of professional was conferred by the Federation of American Motorcyclists a year or two ago, started in the 10 miles Westchester County Interclub race as the representative of the "Bronx Valley Automobile Club." He won the event and immediately was protested on two counts by other entrants, who alleged that he did not own the stripped Buick which he drove, and that the alleged "club" which he claimed to represent existed only in his imagination. The protests were referred to the Contest Board of the A. A. A. for adjudication. J. M. Boyle's Midland took second, the remainder of the field being lost in the dust. Time, 13:22.

The obstacle race, which was held in two sections, was tame and uninteresting. The distance was a quarter mile, and M. P. Batts, S. P. O., won the first class in 0:19½. Byron Chanler, Fiat, captured the second in 0:21. Chanler scored again in the Mendel Cup race for cars under 300 cubic inches, doing the 5 miles in 7:37½. O. F. Rost's Black Crow took second. Smith won the 5 miles club championship in 6:50, running the last two miles on a flat tire.

**The summaries:**

Five miles, Mount Vernon A. C. members—Won by Byron Chandler, Fiat; sec-

ond, O. F. Rost, Black Crow. Time, 7:44.

Ten miles Westchester County Interclub—Won by Russell Smith, Buick (Bronx Valley A. C.); second, J. M. Boyle, Midland (Mt. Vernon A. C.). Time, 13:22. Two protests filed against winner.

One quarter mile obstacle race—Class A, cars 110 inch wheelbase or under—Won by M. P. Batts, S. P. O.; second, W. W. Swan, Hudson. Time, 0:19½. Class B, over 110 inches—Won by Byron Chandler, Fiat; second, W. H. Mendel, Isotta. Time, 0:21.

Five miles club championship, Mt. Vernon A. C.—Won by Russell Smith, Buick; second, M. A. Isaacs, Mercedes. Time, 6:52½.

Ten miles Westchester handicap—Won by Spencer Wishart, Mercedes; second, M. P. Batts, S. P. O. Time, 12:25½.

**Morgan Heeds Cry from the Catskills.**

Although he announced his sad farewell only a few days before, the Motor Contest Association, otherwise W. J. Morgan, again has heard the call of the hotel-keepers. This time it is the call of the Catskill bonifaces that has reached him. Desiring to advertise their resorts and furnish entertainment for their guests and, incidentally, swell their receipts, what more natural than that the Catskillers should cry out for Morgan; they actually "petitioned" him, he says. And as his heart is not of stone, he hearkened to their cry, despite his "farewell." He formulated one of those nice little reliability runs and hill climbing contests and obtained a sanction for it. The affair will last three days—July 16, 17 and 18—and the New York automobile trade, as usual, is expected to "pay the freight." The first day, the reliability runners will meander to the land of Rip Van Winkle and summer boarding houses. The second day will be devoted to rest and summer girls and to the circulation of money, and the last day to a hill-climb up Clove mountain, one of the most dangerous grades in the Catskill range.

**Brooklynites Plan a Montauk Run.**

Disregarding the lessons taught by the Motor Contest Association's Montauk Light or Bust run recently, when one car burned up and three others were marooned all night in the Montauk bad lands, the Brooklyn (N. Y.) Motor Vehicle Dealers' Association has decided that it wants to explore the eastern end of the island, and has scheduled a 400 miles reliability contest for July 19-20. It will average 200 miles a day and is intended to thoroughly cover the island from shore to shore, and pathfinders soon will start to log a definite route. In addition to the contesting division, there also will be a touring class which will travel on a secret time schedule. Hidden controls will be established at various points on the route, and the cars will be checked as they pass. The car adhering closest to the schedule will be designated the winner.

## COFFIN ON STOCK CAR RULES

**Defends them and Says A. A. A. is Not to Blame—Explains Reasons for the "Options" Permitted.**

Editor of the Motor World:

I notice in your issue of June 16, 1910, page 643, that you have jumped upon the American Automobile Association hard for what you term the "Association's half-hearted effort to define a stock car." I know that you will pardon me for suggesting certain corrections in connection with this article.

The rules and classifications governing "Stock Car" and "Stock Chassis" events were formulated by the Active Rules Committee of the Manufacturers' Contest Association, made up of the representatives of five of the leading motor car manufacturers and importers of the country, and were afterward criticized, amended and finally accepted by the General Rules Committee of twenty-five of the representative manufacturers and importers, before being passed on to the Contest Board of the American Automobile Association for incorporation in the 1910 rules. You are certainly, therefore, in error in placing upon the American Automobile Association the responsibility for this portion of the rules.

I believe that you will permit me also to correct the statement in your issue of the 16th by calling your attention to the fact that there are no options whatever permitted in a stock car competition other than the removal of tops, wind-shields and extra tires, even where furnished as regular equipment. It is recognized of course that these parts might lend a very considerable element of danger, particularly in speed contests.

This Stock Car Definition, with its accompanying percentage table was given a lot of time in preparation by a Committee who really pulled off their coats and worked hard last August and September, when most of their friends were taking a vacation, and even at that there has developed an ambiguity in the working of the explanatory clause in connection with the Stock Car Definition which has given rise to the little ill-feeling and opposition to which you refer.

You will note that the "Options Permitted" which you mention, refer entirely to stripped chassis competitions. An ordinary stock chassis, when lightened by the removal of the body and tuned up for fast work, has a speed capacity over the ordinary country roads of from 60 to 90 miles per hour. At such speeds the safety of the occupants of the car and of the spectators is best insured by the permission of such changes as are listed. I will explain these options and the reasons therefore briefly from the standpoint of the men who formulated these rules:

First: Lighter Springs. Logical because

of the removal of from 600 to 1,500 pounds of super-structure weight. Lighter springs are more liable to breakage, but the option is permitted for reasons of comfort to the driver and mechanic.

Second: Piston Diameters. The demands of motor car speed sufficient to drive a car over the road continuously at 70 miles an hour necessitate an additional .001 of piston clearance, for each inch of cylinder diameter. Pistons for this extreme high speed work are a little too loose for satisfactory touring conditions. A few thousandths reduction in piston diameters is necessary as a protection against the wrecking of the motor by the seizing of pistons within the cylinders.

Third: Change of Steering Post Angle. Necessitated by the removal of the body and by the lowering of the seat in such a way as to render the car safe for high road speeds and fast turns.

Fourth: Length and Angle of Change Gear, Brake and Other Control Levers. Necessary because of changed seating conditions just mentioned. Not one of these things can possibly affect the performance of the car, although they may add much to the ease of control upon the part of the operator.

Fifth: Change of Driving Gear Ratio; Wheel Diameters Excepted. Options upon driving gear ratio are given by nearly every manufacturer in the business. Consequently, no restrictions necessary. Wheel diameters, however, must remain as per stock, as well as must spoke sizes, hub flanges and all other parts where entering into the strength factor.

Sixth: Length of Clutch, Brake, Auxiliary and Other Pedals. Option necessary on account of changed seating conditions.

Seventh: Tire and Rim Equipment. Option permitted in accordance with racing practice, both international and national. It is considered that speed competitions are between cars and not between tires. Moreover, tire trouble in high speed contests seems not to be greatly influenced by tire size, many makers uniformly fitting smaller tires for racing purposes than for regular equipment.

Eighth: Style of Dash, Seat and Body Equipment. Option necessary because of removal of body. Many makers also build cars in which dashes are an integral part of the body.

Ninth: Form, Volume and Location of Fuel and Oil Tanks. Option necessary because many tanks located in body or in such position that driver of chassis would be obliged to sit upon the tank, making his position entirely unsafe for racing work. It will be noted that the system (whether gravity, pressure feed or pump) must in either case remain unchanged.

Tenth: Exhaust Header and Exhaust Pipe. Under the Stock Chassis Definition, any parts non-essential for racing conditions may be removed. Safety, however,

dictates that the direction of the exhaust shall be such as not to raise dust.

Eleventh: Shock Absorbers and Winding of Springs. A necessity upon any car to be driven at high speed over American roads. Without them it is doubtful whether the operator could remain in his seat or properly control his car.

Twelfth: Bonnets Must be Carried Throughout Contest. This for the reason that a car with a bonnet removed is not a particularly attractive spectacle.

Thirteenth: Bonnet Straps Must be Added. Nothing is more dangerous to the occupants of a car moving at 70 miles an hour than to have the bonnet become loosened and blown back against them. Not only is the operator apt to lose control of the car momentarily, but the sharp edges of the sheet metal bonnet have been known to inflict serious injuries.

The suggestion made at the close of the Motor World article, to the effect that any car competing shall be understood as purchasable at the list price fixed by the manufacturer's catalogue, at the finish of the contest, is one that has been made many times and that the committee has seriously considered. It has been deemed, however, impractical for a very good reason. This reason is that, inasmuch as it cannot be denied that the motor car manufacturer is largely depended upon by race meet promoters all over the United States for the support of all contests through the entry of cars, it would be entirely too great a hardship to impose upon the maker, were he asked to supply for every contest in which his cars may be entered from Maine to Texas a new car, without any guarantee upon the other side as to whether these cars would really be purchased. It would be a very easy matter and a very certain result that within thirty days' time he would have from ten to twenty second-hand motor cars scattered about and over the country. This condition I believe you will agree to be an impossible one to incorporate in any set of rules for the government of national contests.

The suggestion has been made many times that the cars for entry be obtained at each manufacturer's local agency, but not a maker in the country would be willing to risk the reputation of his product by the entry list of an old agent's demonstrator or by the entry of any car which he did not know to be in A-1 condition. Such a position I believe it may be conceded would be dictated by business common sense.

I note that you refer to the motor car contest as a "sport thoroughly commercialized." I am very glad to be able to say to you that the Manufacturers' Contest Association and the American Automobile Association stand together for the A. A. A. control of the motor car contest. We won't accomplish it all this year, and many faulty places will probably be found in the

1910 rules, but this is the first season that has seen the introduction into the government of contest affairs even the semblance of those same business methods and principles which we would expect in any other work of similar importance.

If Motor World will kindly indicate in the regular method upon one of the Suggestion Blanks, which can be had upon application at the office of Mr. Russell A. Field, assistant secretary-treasurer of the Manufacturers' Contest Association, 1780 Broadway, New York City, wherein the 1910 rules cater to commercialism or are unfair to any entrant, either amateur or professional, I can vouch for it that the committee having this work in hand will be pleased to accord the suggestion every consideration.

I have gone thus into detail in order that you may correct in your next issue the allegation that the American Automobile Association is in any way to blame for the stock car contest situation. The A. A. A. is moving ahead with the best business organization that it has ever had in the performance of a work in which it should and will have the strong support of every trade organization, motor car club and individual owner in the country.

Will you please pardon the length of this communication? I have tried to place matters before you exactly as they stand, and I trust that you will make such use of some portion of this epistle as may correct the impressions conveyed in your issue of June 16th.

Very truly yours,

H. E. COFFIN,

Chairman, Rules Committee,  
Manufacturers' Contest Association.

#### Accident Due to Runaway Wheel.

What probably is the most peculiar accident ever reported as having happened to a touring car in ordinary travel, occurred last week near Hammond, Ind. Charles Bailey, a resident of Hammond, and his family were driving to Lovell at a speed of about thirty miles an hour, when suddenly the front axle broke in such a way that the left wheel ran away from the car, and kept on spinning in the direction in which the car had been going. At the moment of the break, a touring car came at a fair rate of speed from the opposite direction, and the racing wheel headed straight for the center of the onrushing car. Before anything could be done, the runaway dodged under the radiator of this car, which was owned and driven by Charles Larsen, of Lovell, compelling it to hurdle over it and breaking the axle of the Larsen car in almost the identical place in which the Bailey machine had been damaged. Both cars were ditched, but owing to the high grass and soft ground none of the passengers was seriously hurt, although all were more or less bruised and badly frightened, is it needless to add.

## JOKER IN NEW SMOKE ORDINANCE

**New York City's Prohibition Applies to "Dense" Smoke from Automobile Motors—Goes into Immediate Effect.**

After today, any automobile that gives forth dense smoke anywhere in New York City may get its driver in trouble. The Board of Health has so decreed. Until Tuesday last it was likely that any sort of smoke would be illegal but the arguments brought to bear resulted in a substantial modification of the rule when it was finally adopted at the meeting of the board on the 28th inst. While it had been understood generally that all kinds of smoke were to be banished from the atmosphere in, around and above the Big Village, it now appears that only "dense" smoke is tabooed, and that medium dense, thin, attenuated, light blue, and the other 57 varieties of smoke still may soar upward. The anti-smoke resolution which first was discussed in April last came up again on Tuesday last, when it was passed with the important addition of the word "dense" before the word "smoke." It is possible that the new rule will tend to curb the most careless among the "smoking" chauffeurs, insofar as it will provide any policeman with a cause for arresting offending chauffeurs, even if it should be proven later by the defendant, through experts in smoke matters, that the particular kind of smoke his car was alleged to have emitted was not sufficiently dense to come within the meaning of the ordinance.

The full wording of the rule, which goes into effect tomorrow, is as follows:

Sec. 181. No person shall cause, suffer or allow dense smoke to be discharged from any building, vessel, stationary or locomotive engine or automobile, place or premises within the city of New York, or upon the waters adjacent thereto, within the jurisdiction of said city. All persons participating in any violation of this provision, either as proprietors, owners, tenants, managers, superintendents, captains, engineers, firemen or automobile enginemen or otherwise, shall be severally liable therefor.

#### Threaten Farmers for "Mud Trap."

Washington motorists and tourists using the Washington-Baltimore boulevard are up in arms over the remarkable disclosures made during an investigation into the inner workings of an alleged automobile "mud-trap" at Contee, Md. It had been stated at various times that the rural "good Samaritans," who have made an excellent living during the past winter by using their horse teams and logging chains to haul stalled automobiles out of the mire, have viewed with considerable disapprobation the approach of the dry summer season and the consequent drying up of the mud holes. In fact some very strong circumstantial evi-

dence had been submitted tending to show that these same ruralists had hauled barrels of water to the road, so that the mud holes might be maintained in the best possible condition from their own personal points of view.

On Sunday, June 19, two farmers were observed waiting with their teams a short distance away from a depression of the road which had been made impassable by mud and water, and this despite the fact that in that particular part of the district no rain had fallen for several days past. E. J. Terry, of Baltimore, did get stuck in the mud, and in a minute both of these farmers were at his side offering to pull him out for the regular fee of ten dollars. Terry, however, was "wise" to the scheme and struck a hard bargain, under which the farmers agreed to pull him out in ten minutes for a fee of \$4. In a twinkling they produced planks, blocks, tackle, etc., from the near-by underbrush, and rescued the stalled automobile.

Threats of criminal proceedings against the farmers for interfering with traffic and interstate commerce are being heard on all sides, since these facts became known, and the sudden publicity given to their scheme probably will prevent the ingenious farmers from continuing it with any kind of success.

#### Miller's Map of Berkshire Region.

For the benefit of those who may find it possible to tour in the Berkshires, a comprehensive folding map, entitled "To and Through the Berkshires" and showing the principal routes in red, has been prepared by Charles E. Miller, the well known supply man, of New York City, who will send the map to any one upon receipt of three cents in stamps. Requests may be addressed to his home office at 97 Reade street, New York, or to any of his ten branches in the various cities. Eastern New York, Western Massachusetts, Connecticut and Vermont are shown, with eight individual maps giving inter-city routes for such places as New Haven, Hartford, Springfield, Pittsfield, Brattleboro, Poughkeepsie, Albany and Troy.

#### Helps When a Car is Stalled.

While it seldom happens that a bank of sand, dry enough and deep enough to stall a car, occurs within carrying distance of a well or other source of water supply, when such a combination of circumstances does arise it may be considered fortunate. A relatively small quantity of water poured into the wheel tracks will be sufficient to increase the weight of the sand enough to afford a good grip for the tires. Similarly, if a mud hole should be encountered within reach of a sandpit, it is possible to seek salvation by means of a few shovelful of the dry earth, which will absorb sufficient water to stiffen the mud and afford a temporary footing for the wheels.

**CHAMPIONS FOOT ACCELERATOR**

**Engineer Answers the Objections Made to it and Shows its Advantages—Effects on the Motor.**

Incidentally disclosing that the new model Chalmers cars will be equipped with a different form of accelerator pedal from that which is in use on the models now current, G. W. Dunham, consulting engineer of the Chalmers Motor Co., Detroit, Mich., expresses a high degree of confidence in the worth of that type of engine control. While a large proportion of the motorists at the present time are inclined to favor

his citation of which is as follows:

"(1) That it is hard on the motor by applying the power too suddenly; (2) that it is hard on the carburetter; (3) that it makes it impossible to drive the car steadily over rough roads; (4) that it tires the foot."

Answering these objections in order, Mr. Dunham explains:

"It is hard to see where an instant application of power harms the motor. If the motor is properly constructed and the compression not too high (a medium or low compression being the best accepted practice today (an instant throwing open of the throttle can not do damage. While the impulse of the gas engine, as many people believe, is like a hammer blow, at the same

or fore and aft as on our 1911 models in Fig. 1, the foot may be pressed firmly on the floor and there will be no chance of rough roads shaking it up and down on the accelerator.

"The objection of tiring the foot is met by the lever accelerator. The type which we use allows the foot to lie flat on the toe board, sliding forward and back. One may operate this accelerator by placing the ball of the foot on the middle of it, and rocking the foot sideways. Again in the case of fast work in crowded traffic, the toe may be rested on the highest point of the accelerator, which can then be used as a push button. The possibility of operating this accelerator in several ways allows one to shift the position of the foot if it tires.

FIG. 1

FIG. 2

FIG. 3

the use of the foot accelerator from the standpoint of convenience in operation, it remained for the authority in question to point out its advantages from the mechanical standpoint.

In a word, the use of the foot-actuated throttle pedal results in better treatment for the engine, other things being equal, than could be possible with the entire regulation of the motor confined to the hand levers on top of the steering wheel. He even argues that it is a better method of engine control than the automatic governor, for the reason that whereas the latter is capable only of responding to variations in speed, manual operation permits the driver to anticipate conditions which are likely to cause speed changes in the motor and thus to regulate the motor to more uniform speed than would be possible by automatic means. The advantage of the foot pedal in this connection, as he points out, is that it enables the operator to regulate the engine in a proper way regardless of how he otherwise may be engaged in handling the machine at the instant.

Opponents of the foot accelerator have advanced four arguments against its use,

time there is a cushioning effect of the gases which makes the stroke much stronger than many people think.

"As to its being hard on the carburetter—it is hard on the carburetter. That is to say it requires a better carburetter to get a uniform mixture if the throttle is thrown wide open instantly, or is instantly closed. The carburetters which we are using on the Chalmers cars, however, are responding satisfactorily to this test. You can take any of those cars and throw the throttle wide open and the motor will get away without a miss or a skip. I mention our own cars because I know most about them. There are some makes of cars that do not use the accelerator, but a hand throttle control instead, in which cars the motor will spit back and hesitate before getting away. It would, therefore, seem that an accelerator control is better, inasmuch as it compels the car builder to provide a good carburetter.

"The third objection, of course, is valid with a push button accelerator like that shown in Fig. 3. If, however, a lever accelerator is used, alternating either side-ways like Fig. 2, as on the 1910 Chalmers,

"When it comes to operating a car in heavy traffic, an accelerator is practically indispensable, that is, if one wishes to drive one's car smoothly and without racing the motor. It is obvious that you cannot operate a car in heavy traffic with a hand lever and do it easily.

"Further, if one wishes to shift gears properly, an accelerator is absolutely essential. When starting up, to shift gears smoothly, one throws in the first speed, then accelerates rapidly. Just as the clutch is released, slow down the motor, slip the gears across, drop in the clutch, accelerate again, repeating the same performance when going into third. By doing this one can shift the gears nicely and get away with a smooth, uniform acceleration of the car. In going backwards and shifting from third to second, and from second to first, the opposite action is necessary—one should touch the motor up slightly in shifting back. It is obvious that this is impossible with any other control except an accelerator.

"In this matter of shifting gears it is easily seen that the accelerator is easier on the motor than the hand throttle. For

instance, what can be harder than shifting gears without an accelerator control—you set the throttle lever so that there is no danger of stalling the motor, you release the clutch, the motor accelerates rapidly while you are shifting the gears, and when you drop in the clutch the motor is suddenly checked down to the speed of the car. You then shift into third, and this performance is repeated, and again if you have a fourth speed. With the accelerator, as explained above, all this strain is avoided.

"The use of an accelerator is much easier on tires than any other form of control. With an accelerator one is able to start up the car without jerking or vibration in passing from one speed to another. An uneven control, as is well known, causes a jerking of the car which is communicated to the tires, working the fabric back and forth and gradually weakening it. Some may consider this a small point. There is little doubt, however, that the constant working of the layers of fabric one on the other is hard on the tires, and many a blow-out has been due to the tires having been subjected to this kind of a strain."

#### Squeaks Traceable to Grease Cups.

Occasionally the apparent location of a squeak at some point which is provided with a compression grease cup and the application of the usual lubricating means, does not suppress the noise. In such a case, it is well to make certain that the noise actually does occur at the suspected point, and then to remove the bearing or dismount the part, cleaning it thoroughly and giving it plenty of engine or transmission oil. It sometimes happens that the grease in the bottom of a compression cup becomes reduced to a dry cake, which refuses to go through the feeding duct until the latter has been cleared and a fresh supply of grease put in. Another cause of failure on the part of a lubricating device of this class is the use of dirty grease, or the filling of the duct with a short splinter, broken from the end of the paddle with which the grease is ladled into it and unobserved in the process.

#### Semaphores for Taximeter Cabs.

For the benefit of intending patrons who never seem able to locate the taximeter, or who fail to remember which position of the little red flag indicates that the vehicle is disengaged, a foreign inventor has contrived a semaphore arrangement which is intended to be mounted on the roof of the cab and which carries a "For Hire" sign. When the taximeter flag is up, signifying that the machine is available for use, the semaphore also is raised. But when the flag is turned down into the running position which starts the recording mechanism, the semaphore automatically is dropped down on the roof of the cab and so becomes invisible.

## HAS GLASS HOOD ON HIS TORPEDO

Pullman Sales Manager "Demonstrates" while Touring in Special Runabout—  
Features of the Body.

It might be supposed that a man as intimately associated with the automobile as a sales manager has to be would be glad to "get away from business" whenever he could, and especially would not be inclined to exercise a particular taste in the matter of the car which happened to be devoted to his own use. Factory people know that such is not the case, however, but quite the reverse. The accompanying picture af-

it may be mentioned that even after much hard usage over standard Pennsylvania roads, no flaw has developed in the glass of the hood, despite its fragile character.

#### Economy in Electric Lights.

Ordinarily the use of electric lights on motor cars is recommended on a basis of illuminating efficiency and convenience of operation. That the system also may be made to yield better economy than either oil or gas is the claim of the Fostoria Incandescent Lamp Co., Fostoria, O., which has just prepared a special bulletin on the subject and also a booklet on the subject in more condensed form. In the latter publication the assertion is made that two headlights equipped with 16 candle power

SPECIAL PULLMAN TORPEDO RUNABOUT WITH GLASS HOOD.

fords an ocular demonstration of the fact.

The light torpedo runabout shown is a special "job" put up according to the ideas of Sales Manager Herbert R. Averill, of the Pullman Motor Car Co., of York, Pa. It is built on the standard model "O" Pullman chassis, which is a light, four-cylinder machine of 30 horsepower rating. The body lines disclose a compact, two-passenger body, with the high sided effect which is valued for its exclusion of dust and chilling draughts, while the oval gasoline tank mounted in the rear affords a neat method of finishing off the posterior section. The car is painted a dark slate color with "satin" finish.

By way of adding a touch of the "demonstrator" to the car, and also as a perpetual novelty, the glass paneled type of hood is employed. For evening use, arrangements are made to have the interior electrically illuminated so that the working of the engine is plainly visible from the outside. As having a bearing on the smooth running qualities of the motor and also on the easy properties of the spring suspension,

Mazda improved tungsten filament lamps will give three and a half times as much light on any given point in the roadway as two acetylene headlights with standard sized burners, and at less than half the cost. Putting the comparison another way, it is stated that two 16 candle power searchlights, two 2 candle power side lights, and one 2 candle power tail-light may be operated for considerably less than the cost of operating two acetylene headlights supplied by a gas tank. The claim is based on the assumption that the headlights will be used only about half the time.

#### Charcoal for Valve Grinding.

Although it is commonly supposed that for valve-grinding purposes the use of emery powder or pulverized glass is indispensable, an experienced gas engine man vouches for it that a simple and easily procurable substitute for the usual abrasives may be found in ordinary willow charcoal. Mixed with kerosene oil, he asserts, the charcoal will work the valve and seat down to a fine surface.

**NEW "SERIES" REVEALED BY KNOX**

**Definite Abandonment of "Yearly" Models  
—Changes and Modifications in the Offerings—Two Chassis Used.**

Although a large number of American manufacturers long since have abandoned the practice of rating their product on the season basis, comparatively few have emphasized the fact by eliminating the year

fications for their immediate successors. Model "R," which is the four-cylinder machine, has been altered to this extent:

The wheel base has been increased to 122 inches from 111, the former specification for the touring model. The front axle has been moved 2 inches farther forward than before, now is made of nickel steel, heat treated; and its pivot bearings (which, like the front wheel bearings, are Timken mounted) are adjustable for wear. Incidentally, in adopting Timken roller bear-

the gearset and the extension of the shifting slide across the case to prevent binding and rattling are other significant changes. Such other changes as have been made are of a minor nature.

The six-cylinder chassis, model "S," has been modified even less than the four-cylinder car. The engine timing gears and gearset have the same modifications which have been mentioned as applying to model "R." The new front axle is made from extra heavy nickel steel drop forgings, heat

KNOX "S" 6-60 STANDARD TOURING—\$5,000

KNOX "S" CLOSE-COUPLED—\$4,900

KNOX "R" 4-40 SMALL TONNEAU—\$3,350

KNOX "R" SERIES B TOURING CAR—\$3,500

KNOX "R" SERIES A DOUBLE RUNABOUT—\$3,250

KNOX "R" 4-40 CLOSE-COUPLED—\$3,250

numerals in the designation of models. The few, however, have been increased by the Knox Automobile Co., Springfield, Mass., which, in connection with the announcement of the changes in its line, which will obtain through the remainder of this year and into next, inaugurates the system of designation by means of letters and series. Thus, Models "S" and "R," heretofore produced, will be continued. But to distinguish between the issues of these models which may differ in more or less material respects, they will be known as series "A," "B," etc.

Of the two models now current, few changes have been made in drawing speci-

ings for all front wheels, the Knox company declares that that type better fulfills the requirements of the severe front wheel load than any other type with which it has experimented. In the rear axle, however, Hess-Bright annular ball bearings are used. The axle is of Knox design, full floating in arrangement and contrived to permit the dismounting of the entire differential mechanism if necessary. Torsion rods are to be employed on all models of the four-cylinder chassis, while the use of nickel-steel, wide flanged frames, the use of cast iron magneto idler gears instead of fiber, the use of double annular ball bearings on the rear lay shaft and rear center bearings of

treated, and the pivot bearings are designed to provide adjustment for wear. The frames, which are made exceptionally heavy, are of nickel steel. On all types, excepting the raceabout, the wheels will be 38 inches in diameter, shod with 5½ inch Fisk bolted on and detachable type rim and tire equipment.

Unusual variety is introduced into the new line of body designs. They include five and seven passenger touring cars with torpedo type fronts, five passenger small tonneaus and raceabouts possessing the high-sided front formation, and the regulation torpedo type with its rotund rear portion. All bodies are made with flush

sides except the touring and small tonneau types, which are widened out back of the doors to give additional length for the rear seats. The rear portions of the small tonneau machines, it may be mentioned, are made detachable. There are also two enclosed types, limousines, one for each of the two chassis. All bodies, which are made at the Knox factory, have wood frames with steel and aluminum shells.

In both types of chassis the standard form of unit power plant construction, which has been in use since 1907, is retained. The cylinders are of overhead valve formation, with separate heads, water

cylinder motor, Bosch magneto equipment is employed in conjunction with the Atwater-Kent single spark battery system.

The change gear system is mounted in a strongly constructed extension to the crank case, which is securely bolted in place to form the rearward portion of the power unit. The gearset is of the selective pattern, embracing unusually short lay shaft and compact arrangement of gears. It affords three forward speeds in addition to the reverse, and has the merit of doing away with the thimble bearing at the rear end of the driving shaft, having instead a short shaft extension mounted on an an-

bers being expanded by means of adjustable eccentric cams acting on Raybestos faced shoes. The service contracting brakes are prevented from dragging by means of a special spring device which acts above and below. As in the current models,

IMPROVED SIX-CYLINDER 60 HORSEPOWER POWER UNIT

ENGINE FRONT AND TIMING GEARS

STEERING KNUCKLE ARRANGEMENT

REAR AXLE ASSEMBLY ON NEW FOUR-CYLINDER MODEL

cooled. The sextuple motor is assembled with cylinders cast in pairs, but the four-cylinder unit is made up of single cylinder castings. The valves are actuated from push rods on the right hand side, while on the left are mounted the magneto and carburetter. Outside the cam housing on the right are carried the large centrifugal water circulating pump, and the auxiliary motion shaft which drives the oil circulating pump for the engine and the vertical timer. The lubricating system is of the constant flow type with feeds to the crank shaft and connecting rod bearings through internal ducts. Ignition on the four-cylinder motor is accomplished by Bosch magneto and Connecticut timer with dry cells, two sets of spark plugs being employed. On the six-

nular ball bearing. The running of the set is considerably improved by the addition of the double annular bearings which are to be found in the newer models only. The master clutch, as hitherto, is of the three-plate type, with cork inserts.

In connection with the spring suspension of the chassis, shock absorbers are used on all models. Semi-elliptical springs are used in front and three-quarter scroll elliptics in the rear. This equipment applies to all but the standard runabout types, which have semi-elliptic equipment in the rear, as befitting the special class of work for which they are intended. On the new model "R" chassis, the upper member of the rear springs has been lengthened out somewhat to afford added resiliency to the suspension.

All brakes are of the double, expanding and contracting type, the emergency mem-

all types are listed at prices inclusive of equipment. The specifications of the equipment include top, glass wind shield, speedometer and clock, baggage rack, Prest-O-Lite tank, combination oil and electric lamps for the dash and rear, tire irons, covers and tools, in addition to the shock absorbers already mentioned.

#### To Guard Against Injury to the Body.

When mounting tire holders on the running board, care should be taken to see that they are firmly attached to some portion of the body or frame which is capable of withstanding the not inconsiderable strain which one or two heavy shoes and the contents of a circular trunk may impose upon them. If they are affixed merely to the unsupported side panel of the body, there is not a little likelihood that in the course of time it may bulge out of shape.

THE superiority of the New Rambler motor is recognized because of its exclusive advantages of efficiency, simplicity and accessibility. Efficient because the Offset Crank-Shaft increases power and enables you to throttle down on high gear no faster than a man usually walks. Simple because of the one-piece crank case and direct-acting overhanging valves. Accessible because the wedge-type main bearing permits adjustment from above, while the crank case opening is at the side. The Straight-Line Drive saves power by avoiding the corner or angle in other driving systems; thirty-six inch wheels increase clearance, improve the appearance and make riding comfortable, while the Spare Wheel obviates tire trouble.

### Aligning Clutch and Gear Box.

Where a universal joint is interposed between the clutch and gear box it is worth while to examine the parts very carefully, when looking over the mechanism, in order to distinguish any signs of excessive motion of the parts. Theoretically there should be very little movement in this joint; hardly enough, in fact, to leave a trace of wear on the working surfaces. If any wear has taken place, or if there are signs of a considerable range of movement, it is well to line up the parts with a view to correcting the difficulty.

Disalignment may be caused through yielding at some point in the frame, disarrangement of the mechanism or as a result of carelessness in assemblage. To discover the cause and remedy the defect, whatever its origin may be, is doubly important, because, in addition to revealing danger points in the chassis, the motion of the joint is bound to absorb a certain amount of power, reducing the effective output at the rear wheels.

### Why an Engine May Not Slow Down.

Sometimes the operator is puzzled to find that his engine exhibits a tendency to refuse to slow down to its proper minimum speed in response to the movement of the spark and throttle levers; or again, that it refuses to attain its proper maximum speed. In either event, when the usual means for correcting carburetter and ignition troubles have been exhausted and all adjustments are known to be correct, it is well to look to the connections which lead from the steering column to the auxiliaries. In not a few methods of connection, it is possible for a slipped set screw or a sheared key to cause the connecting levers to assume a false position with relation to the position of the control levers. In a similar way, the loosening of a lock nut on the turn-buckles, which frequently are employed to provide the necessary range of adjustment, may be responsible for the difficulty.

### Determining Fuel Nozzle Sizes.

Certain types of carburetter are made with interchangeable fuel nozzles. In such carburetters it is possible that the nozzle first employed may not suit the engine. To determine whether its orifice is of the proper diameter it is necessary only to observe the adjustment of the auxiliary air valve. If the valve spring adjustment is required to be so slack that the valve is unseated when the engine is running at its slowest possible speed, that fact may be taken as indicating that the nozzle is too large. If, on the other hand, the spring tension necessary to a good running mixture is very great, so that the valve remains closed the greater part of the time, and only opens at very high speeds, it is probable that a larger nozzle can be employed to good advantage.

### Four Cylinders for an Air Pump.

Four cylinders for a tire pump are a feature of one of the more recent mechanical contributions toward making possible the easy inflation of automobile tires. The de-

vice is known as the Hawthorne four-cylinder automobile pump, and after being temporarily clamped to the running board of a car, it is operated by a simple hand crank action, as one would wind a small bucket of water up in a well. As will be seen by the accompanying illustration, the pump has a clamp at the bottom, for attaching it to the running board or to a work bench in a garage. The complete outfit, including the pump, rubber tubing, pressure gauge and a containing box with lid and handle for carrying, sells for \$15, the output being marketed by the Westchester Appliance Co., of New York City.

### Two Forms of Tire Pressure Gauge.

Tire accessories as a class have taken on an added importance by reason of the advances in price which tires themselves are undergoing from time to time and the corresponding concern which is felt about prolonging their service when they are on a car. As a means of determining the proper

inflation for tires, the tire air pressure gauge has become a well established device, but subject to such improvements as may be embodied in the new offerings of the different makers. Among the most recent in the Edelmans tire gauge, which is shown in the accompanying illustration and which is made by E. Edelmans & Co., of Chicago, Ill. The gauge sells for \$2, and it is claimed for it that it is small enough to be carried in the vest pocket and that

the exact pressure in the tire may be learned simply by pressing the lower end of the gauge against the tire valve. It will be seen that the gauge, which is known as the No. 1, carries a scale of proper tire pressures for the various sizes, respectively. The company also makes what it terms the No. 3 Edelmans tire pump gauge, selling for \$3, which may be used while the pump is applied to the tire, the indicator being mounted on a T-connection between the tire valve and the pump connection, which latter has a valve of its own in order that the indicator reading will be that of the tire and not the pump pressure.

### Play in the Steering Connections.

Joints in the steering connections, which are designed to permit of adjustment for wear, require frequent inspection. It is possible that they may become loose as a result of the natural abrasion which may be expected of any rubbing surfaces which are exposed to dust and mud, or they may become loose through the failure of the securing means to hold properly. In either event, excessive play between the parts is a source of danger.

### Three Point Support Precautions.

In overhauling chassis which have the three-point method of support for the power plant, great care should be taken to see that each of the supporting fastenings is in good condition. For the success of the system it is essential that freedom of movement should obtain in each of the joints, while lost motion, weakened brackets, rivets or bolts, or even excessive wear, may lead to serious trouble. Should one of the fastenings give away it is evident that the entire assemblage would fall.

### Secret of Starting "on the Spark."

Motorists who are unsuccessful in attempting to start the motor "on the spark" may have better success if they learn always to open the throttle wide for an instant before shutting off the spark on coming to rest, and also never to throw on the switch while the spark is advanced. The former precaution ensures a fairly rich mixture for the cylinders, while the latter provides a point of ignition suitable for a state of rest.

### What May Cause Clutches to Drag.

In master clutches of the type which is engaged by means of a series of springs arranged around the driving shaft, it is important that the springs should be substantially of uniform tension. Otherwise it is likely that in the course of successive dismantlings of the clutch the weaker members may be placed adjacent to one another, in which event the clutch will not engage uniformly, but will tend to drag when released, and to pick up its load in a jerky and uneven manner.

## RECENT PATENTS.

958,754. High Frequency Magneto. Theodore M. Mueller, New York, N. Y. Filed Aug. 4, 1908. Serial No. 446,923.

1. The combination of a permanent magnet provided with poles, a magnetic member provided with poles and spaced apart from said permanent magnet, an inductor having a portion adapted to pass successively all of said poles, and a core disposed intermediate said magnet poles and also intermediate said poles of magnetic material.

958,867. Cap for Valve Stems for Pneumatic Tires. George F. Foss, Los Angeles, Cal. Filed Dec. 5, 1908. Serial No. 466,090.

In a valve stem for pneumatic tires, the combination of a valve stem provided with a flat bearing face, of a cover therefor, a spring mounted on the inner face of the cover and projecting therefrom, said spring adapted to contact with the bearing face formed on the stem to maintain the cover in spring tight frictional engagement with the valve stem.

958,897. Carburetter. James W. Snedeker, Adrian, Mich. Filed June 6, 1907. Serial No. 377,532.

1. In a carburetter for explosive engines, the combination of a carburetter chamber, a gasoline feed nozzle extending vertically into said chamber, means for maintaining the gasoline in said nozzle at a uniform level, a hollow, perforated cone through which air may pass, said cone extending into the carburetting chamber free from the wall thereof and around which the air is adapted to pass, said cone surrounding said feed nozzle from the apex of which said nozzle projects and onto which gasoline from the nozzle is adapted to flow, a receptacle at the base of the cone for the surplus gasoline and means for regulating the flow of gasoline through the nozzle.

958,955. Detachable Sprocket Wheel. Otto Curlman, Chicago, Ill. Filed June 8, 1908. Serial No. 437,378.

The combination of a split sleeve, a shaft, a key interposed between the sleeve and the shaft, said sleeve provided with a conical periphery at one end thereof, and with external screw threads at the other end thereof, a sprocket wheel provided with a central hole arranged to fit the conical periphery of the sleeve, a key interposed between the sprocket wheel and the sleeve, a nut provided with internal screw threads arranged to fit the screw threads on the sleeve, and a split pin, said sprocket wheel being provided with holes and said nut arranged to cover the said holes and provided with a flat side arranged to successively uncover said holes as the nut is turned into place, so that when the split pin is in said uncovered hole the nut is locked; substantially as described.

958,963. Combination Roller Bearing. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Company, Harrison, N. J., a Corporation of New Jersey. Filed Oct. 18, 1909. Serial No. 523,286.

1. In a self-contained roller bearing, the combination, with a hub having oppositely inclined conical seats with a channel between their bases and a ball-race in the channel adjacent to each base with a series of balls therein, of two series of conical rolls fitted to the conical seats on the hub, a casing having tapering seats to embrace the outsides of the two series of rolls, and thrust-rings fitted movably to the inner

ends of the rolls and provided with ball-races to embrace the two series of balls, and means for supporting the adjacent ends of the rings upon one another to resist end-thrust.

958,985. Starting Device for Automobile Engines. Axel M. Walstrom, Minneapolis, Minn. Filed Jan. 6, 1910. Serial No. 536,649.

1. In a starting device for automobile engines, the combination of an automobile having an explosive engine and a starting crank therefor, of a pulley provided near said crank, a flexible connection co-operating with said pulley and having one end attached to the handle of said crank and its other end provided with a handle detachably supported on a suitable bracket near the seat of said automobile.

959,014. Engine Starting Mechanism. Frank D. James, Seattle, Wash. Filed June 9, 1909. Serial No. 501,197.

1. An engine starting appliance comprising in combination with the engine shaft, a rotatably supported member, companion coupling parts secured to said member and shaft, said member being shiftable to couple and uncouple said parts, a slide member having spiral driving connection with said first member, and shifter mechanism connected with said member.

959,047. Drive Chain. Warren J. Belcher, Hartford, Conn., assignor to The Whitney Manufacturing Company, Hartford, Conn., a Corporation of Connecticut. Filed Dec. 16, 1909. Serial No. 533,423.

A drive chain consisting of links comprising oppositely disposed side-plates and non-rotatable pins extending through the side-plates near the ends thereof, and other links comprising oppositely disposed side-plates and non-rotatable bushings extending through the plates near the ends thereof, a pin of one of said links extending through a bushing of the other link to constitute a chain, one of the side-plates having the pins secured therein, being separable from its opposite side-plate, and one of the bushings of the other link being secured to one of the pins in said separable plate whereby the removal of said plate will withdraw one bushing from the chain to permit the separation of the latter.

959,958. Wheel. John L. Jackson, River Forest, Ill. Filed March 11, 1909. Serial No. 482,846.

1. The combination with a wheel having a fixed rim, of a demountable rim comprising a tire-supporting member having tire-retaining flanges, one of said flanges being removably mounted on the outer surface of said supporting member, means fitting between said fixed rim and the supporting member and detachably connected with said supporting member for holding said removable flange in operative position thereon, and means for detachably securing said supporting member on the fixed rim.

959,070. Starting Mechanism for Explosive Engines. Charles E. Reddig, Hartford, Conn. Filed July 31, 1908. Serial No. 446,254.

1. The combination of a driving shaft, a driven shaft, and gearing interposed between the said shafts comprising a two-part casing, one of which parts is connected with the driving shaft, a spring in the casing connected at one end to the other part of the casing, a starting clutch interposed between the other end of the spring and

the first-mentioned part of the casing, a backing ratchet connection between the two parts of the casing, and a main clutch between the last mentioned part of the casing and the driven shaft.

959,087. Controlling mechanism for Motor Vehicles. Lawrence Whitcomb, Brookline, Mass. Filed March 15, 1909. Serial No. 483,470.

1. In a motor vehicle, in combination, a motor of the explosive type, mechanism driven by said motor for propelling the vehicle, means to operatively connect and disconnect said mechanism with and from said motor, a valve to control the supply of explosive medium to said motor, a chamber containing a diaphragm operatively connected with said valve, a liquid pump driven by said mechanism and actuated only when the vehicle is in motion and connected with said chamber to create a pressure upon said diaphragm by a moving body of liquid, and means for regulating the liquid pressure upon said diaphragm to operate said valve and control said motor when the speed of the vehicle reaches a predetermined point, substantially as described.

959,129. Universal Joint. Allen H. Fetter, Galion, Ohio. Filed Jan. 12, 1909. Serial No. 471,939.

1. A device of the character described, comprising complementary semi-globular socket-members, having complementary recesses forming stud-sockets, means for connecting together said socket members, a ball member received by said complementary semi-globular socket members, having slots therethrough, said slots being substantially 8-shaped in general outline, studs forming trunnions, received by said stud sockets, and ring members arranged upon said trunnion forming studs, said trunnion forming studs engaging said 8-shaped slots and having heads upon their ends engaging the outer ends of said sockets and the inner edges of said ring members, respectively.

959,231. Propelling Mechanism for Motor Vehicles. Elie Lacoste and Emile Battmann, Paris, France. Filed Dec. 14, 1909. Serial No. 533,123.

1. A motor mechanism for vehicles composed of a series of separate independent casings each containing its own mechanism, the ends of the casings being provided at the circumference with tongue and groove joints, and having journaled in their ends coaxially with the tongue and groove a series of separate, independent-driving shafts units adapted to engage automatically at their ends in driving relation, the casings when bolted together at their ends forming a continuous rigid straight line connection between the cranking shaft and the back axle-tree.

959,298. Steering Wheel for Automobiles. Roy E. Bowers, Hartville, Ohio, assignor to John A. Bowers, Payette, Idaho. Filed Oct. 30, 1909. Serial No. 525,438.

1. An axle having a terminal eye, a bolt extending vertically therethrough and having a cap nut, and a steering knuckle consisting of a casing having bearings for the lower end of the bolt and for the cap nut at the upper end of said bolt.

959,336. Vehicle Spring. Charles B. Geiger, Manning, S. C. Filed Dec. 18, 1909. Serial No. 533,931.

1. In a shock absorber for vehicles, the

combination with an axle and body spring, of upper and lower plates fixedly secured to said body spring and axle, helical springs interposed between said plates and dished holders arranged on the opposite terminals of said springs and bearing on said plates, and tension rods passing through said springs, plates and dished holders.

959,374. Wind Shield. Emile J. Montigny, New York, N. Y. Filed May 14, 1909. Serial No. 495,966.

1. The combination of a dashboard provided with a panel, a plurality of sashes journaled relatively to said panel and disposed to fold side by side in planes parallel therewith, one of said sashes, having a diagonal measurement greater than the width of said panel, and a side panel journaled relatively to said first-mentioned panel and adapted to fold relatively thereto for the purpose of protecting the edges of said sashes when the latter are folded.

959,394. Differential Gearing. Henry August Hugo Salomo, Melbourne, Victoria, Australia. Filed Nov. 27, 1908. Serial No. 464,589.

1. A speed varying gearing comprising an oscillating wheel, a ball and socket bearing for said wheel, a projecting spindle on said wheel, a crank connected with said spindle for actuating the wheel, said oscillating wheel being provided with a series of teeth a stationary part having a series of teeth thereon of corresponding depth but different in number from the teeth on the wheel, and means on the periphery of the wheel for transmitting its rotary motion.

959,426. Means for Locking Detachable Flanges on Demountable Rims. Alexander Dow, New York, N. Y., assignor to Dow Rim Company, New York, N. Y., a Corporation of New York. Filed Dec. 11, 1909. Serial No. 532,659.

1. In a wheel, a fixed member, a demountable rim therefor, means to secure

the rim to the fixed member, a split ring on the rim, the fixed member having a part to engage the end portions only of the split ring to lock it in position when the rim is secured to the fixed member.

# AJAX TIRES

**GUARANTEED 5000 MILES**

When, five years ago, we first issued our written guarantee of 5000 miles our ability to support it was doubted.

Experience has proved that AJAX TIRES more than sustain their guarantee. That fact alone justifies its continuance.

It's the uniformly high quality in the tire that has made such a guarantee possible over a period of five years.

The AJAX Guarantee is your tire insurance policy. Ask our branch nearest you for a copy.

## "Arc Flame System" Magneto

High tension, with stationary, removable coil. No moving wire on the armature. Each spark is followed by an arc flame. This arc flame will ignite a much weaker mixture than with the spark produced by the usual coil ignition. A variation of 45 degrees is allowed on the magneto shaft, which means 45 degrees in the crank shaft for a four cylinder, four cycle motor, as the magneto runs at crank shaft speed.

The retarded spark is just as efficient as the advanced spark, making it easy to start the motor with a quarter turn of the crank, with the timing lever fully retarded.
